#### Whose problem is this to solve?

### It is a Medical Problem

National Vital Statistics Report, Vol.49, No.11, October 12, 2006 Deaths and percent of total deaths for the 10 leading causes of death: USA

Rank	Cause of death	<b>Total Deaths</b>	Percentage
	All causes	2,391,399	100.0
1	Diseases of heart	725,192	30.3
2	Malignant neoplasms	549,838	23.0
3	Cerebrovascular diseases	167,366	7.0
4	Chronic lower respiratory diseases	124,181	5.2
5	Accidents (unintentional injuries)	97,860	4.1
6	Diabetes mellitus	68,399	2.9
7	Influenza and pneumonia	63,730	2.7
8	Alzheimer's disease	44,536	1.9
9	Nephritis, nephrotic syndrome and nephrosis	35,525	1.5
10	Septicemia	30,680	1.3
	All other causes	484,092	20.2

#### What are the Fundamental Questions?

#### For cardiologists, pharmacologists and patients:

- What is the risk of a patient to develop the disorder?
- Under what circumstances will such a disorder arise?

#### Given a disorder-specification and a model of the ventricle:

- What is the probability of the model to satisfy the specification?
- For what parameter-ranges does it satisfy the specification?

#### Whose problem is this to solve?

#### **CMACS: Multi-Institutional, -Disciplinary Team** 7 Universities, 2 Colleges, 14 Departments/Schools

#### **CMACS** Atrial-Fibrillation Team

### It is a Cellular Problem

### It is an Electrical Problem

$$\dot{\mathbf{V}} = -(\mathbf{I}_{Na} + \mathbf{I}_{Ca} + \mathbf{I}_{CaK} + \mathbf{I}_{K1} + \mathbf{I}_{NaCa} + \mathbf{I}_{NaK} + \mathbf{I}_{Cab} + \mathbf{I}_{Nab} + \mathbf{I}_{Kr} + \mathbf{I}_{Ks} + \mathbf{I}_{Kv1.4} + \mathbf{I}_{Kv4.3} + \mathbf{I}_{p(Ca)} + \mathbf{I}_{stim})$$

#### - Rate of change in membrane potential (V):

Sum of physiological currents due to ion flows across membrane

#### - Physiologically detailed: 67 variables

Difficult to simulate and formally analyze

### It is a Cellular-Abstraction Problem

### It is a Molecular Problem

## It is a Molecular Abstraction Problem

#### It is a Molecular Abstraction Problem

These result appeared in CMSB 2012

#### **Nonlinear Hybrid Automaton**

#### 2D/3D Simulation of Partial Differential Equations

$$\dot{u} = \nabla (D\nabla u) - (J_{fi} + J_{si} + J_{so})$$

#### PDEs are simulated as Finite Difference Equations

### It is a Verification Problem

## It is a Verification Problem

Genetic regulatory network with Parameters  $\kappa, \gamma$ 

$$\dot{x}_i = f_i(x,p) = \sum_{j \in P_i} \kappa_{ij} r_{ij}(x) - \sum_{j \in D_i} \gamma_{ij} r_{ij}(x) x_i$$

#### **Kripke Structure for Fixed Parameters**

Computation of transitions: By examining corner flows

Ramps

### It is a Verification Problem

Genetic regulatory network with Parameters  $\kappa, \gamma$ 

$$\dot{x}_i = f_i(x,p) = \sum_{j \in P_i} \kappa_{ij} r_{ij}(x) - \sum_{j \in D_i} \gamma_{ij} r_{ij}(x) x_i$$

These results appeared in CAV 2011, LNCS 6806, pp. 396-411, 2011.

### It is a Control Problem

**Defibrillation with 90% energy reduction** 

### It is a Control Problem

Low Energy Defibrillation (LEAP) tested for Canine Hearts

For Both AF and VF we have found successful defibrillation with LEAP using about10% of the energy required by the standard 1 shock defibrillation protocol

Furthermore, using high resolution mCT We obtained detail vessel distribution of the heart and found a scaling law which was used to obtain a theory that explains the mechanism behind LEAP.

These results appeared this year in Nature, Jul 13 475(7355):235-9; 2011

#### It is a CPS Problem

# We are on the brink of a paradigm shift in the Diagnosis and treatment of cardiac disorders

It is up to us in to make it happen!
