

"AI Now Detects the Majority of New Malware on Android"

Submitted by [grigby1](#) on Mon, 10/02/2017 - 1:25pm

There has been a significant increase in the detection of new malware on Android devices through the utilization of machine learning by Google. The implementation of machine learning into Google Play Protect, an automated application security software within Android devices, has decreased the number of devices affected by malware by almost 60 percent. This article further discusses the implementation of machine learning into Google Play Protect, the results that have recently come from this implementation, changes that have been made in the detection of malware by Android's team of security researchers and machine learning experts, along with the growing use of machine learning within the cybersecurity industry.
