

?Website Attacks Surge: Report?

Submitted by [grigby1](#) on Wed, 10/11/2017 - 4:12pm

SiteLock's Website Security Insider report reveals the average number in which websites have been targeted by cyberattacks each day in the second quarter of 2017. The average number of attacks aimed toward websites have increased significantly from 2016. Malicious bots have been found by researchers to be involved in the majority of these attacks targeting websites. This article further discusses the findings shared within this report by researchers in pertinence to the types of attacks faced by websites, aspects that contribute to the increasing risk of attacks on websites, and more.
