

Collaborative Research: NRI: Dispersed Autonomy for Marsupial Aerial Robot Teams (Award #s 2133142 and 2133141)

Eric Frew (CU), Brian Argrow (CU), Adam Houston (UNL), and Zachary Sunberg (CU)

Motivation and Broader Impact

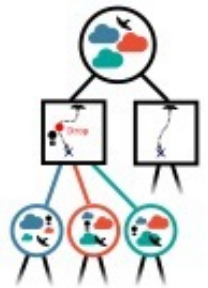

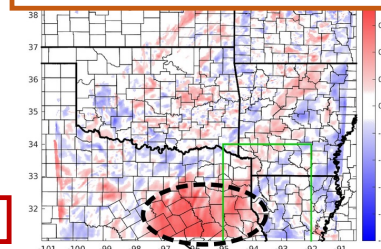

This work will realize the vision of an **autonomous airborne meteorologist** that performs online targeted observation and forecasting of complex weather.

Research Plan

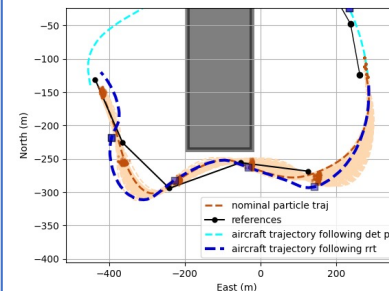

Air Launched Drifters

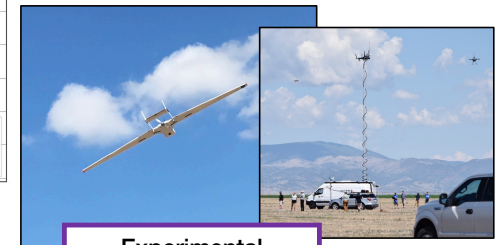

Ensemble Sensitivity Analysis and Subsetting

Information-Space Planning for ALD Deployment

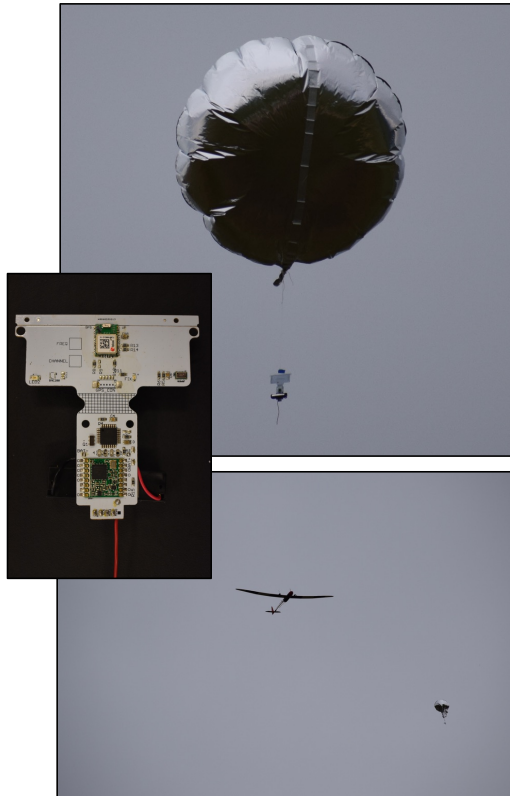

Parallelized Path Planning in Uncertain Flow

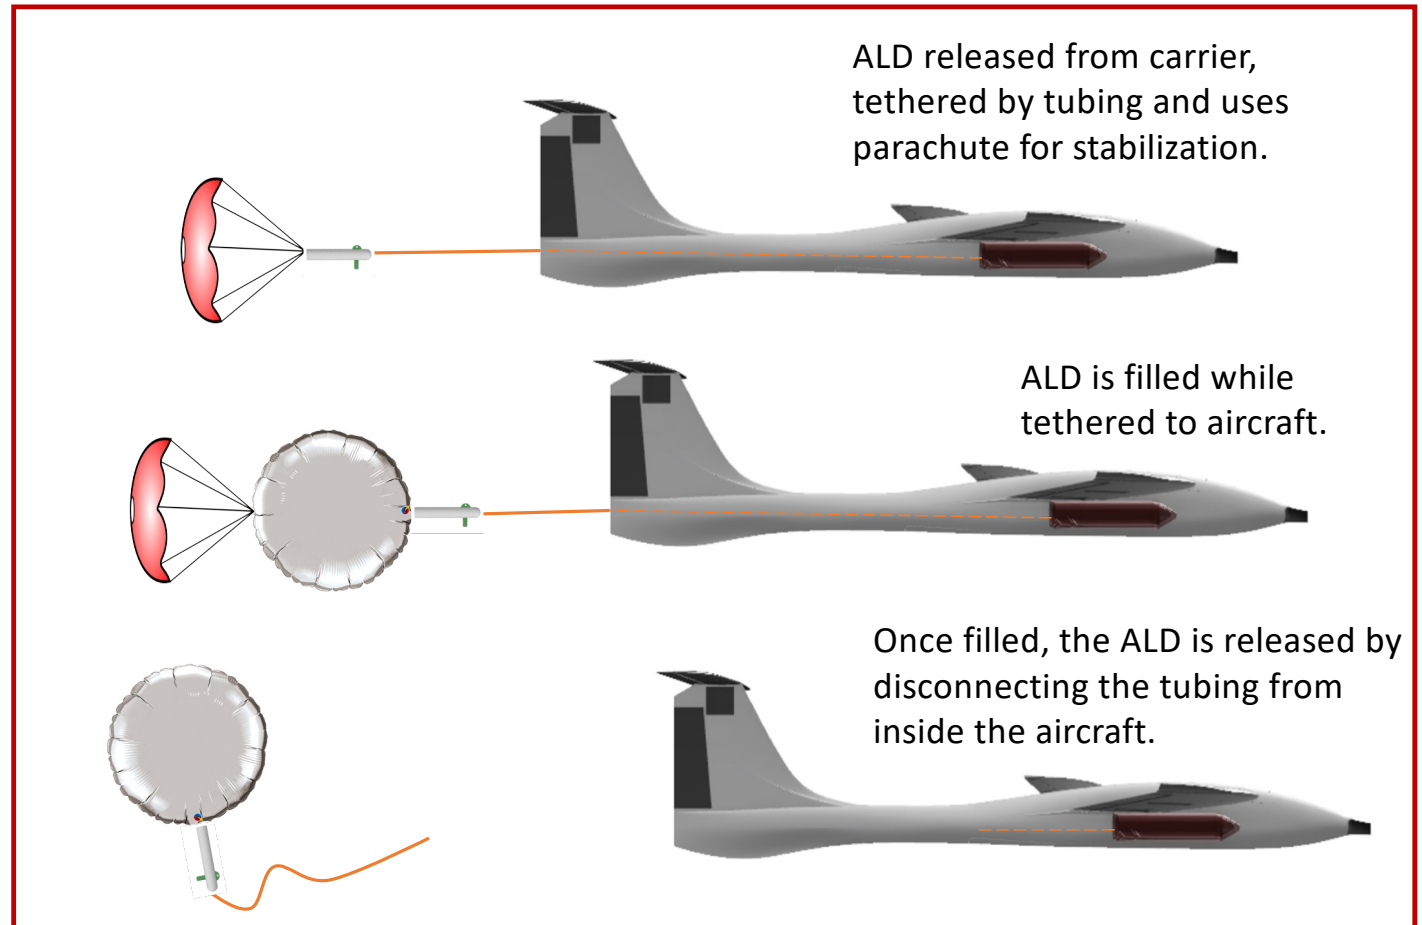

Experimental Assessment

This project advances current practices through new devices and algorithms integrated, deployed, and evaluated on **marsupial aerial robot teams (MARTs)** whereby small uncrewed aircraft systems (SUAS) provide in-situ observations of the atmosphere through on-board sensors and air-launched pseudo-Lagrangian drifters. The project culminates in experimental assessment through a field campaign in complex weather conditions

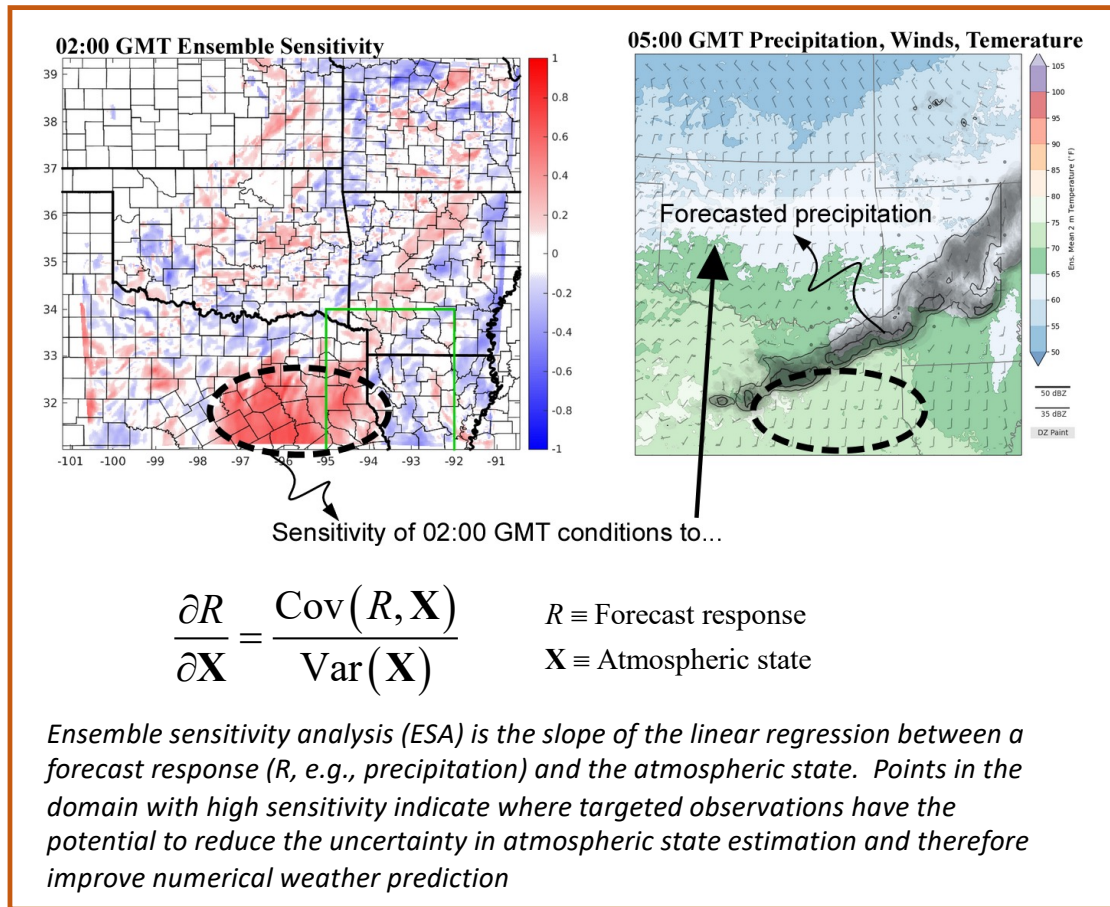

Semi-Lagrangian Air Launched Drifters (ALD) for Atmospheric Sensing

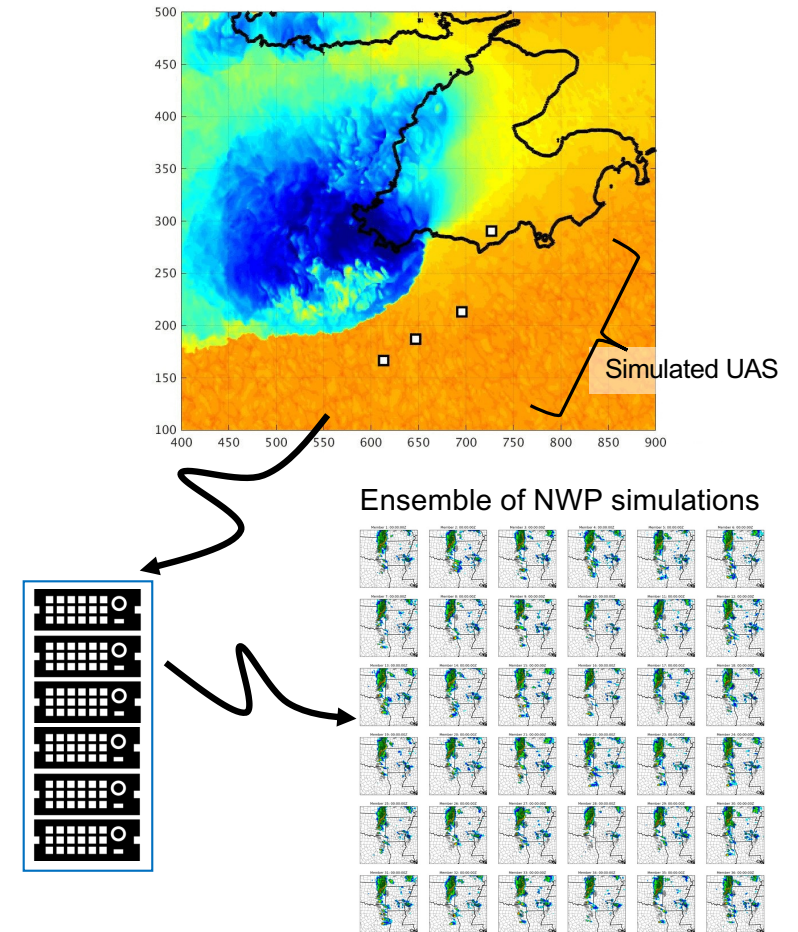

Prototype ALD demonstrating proof of concept

Ensemble Sensitivity Analysis

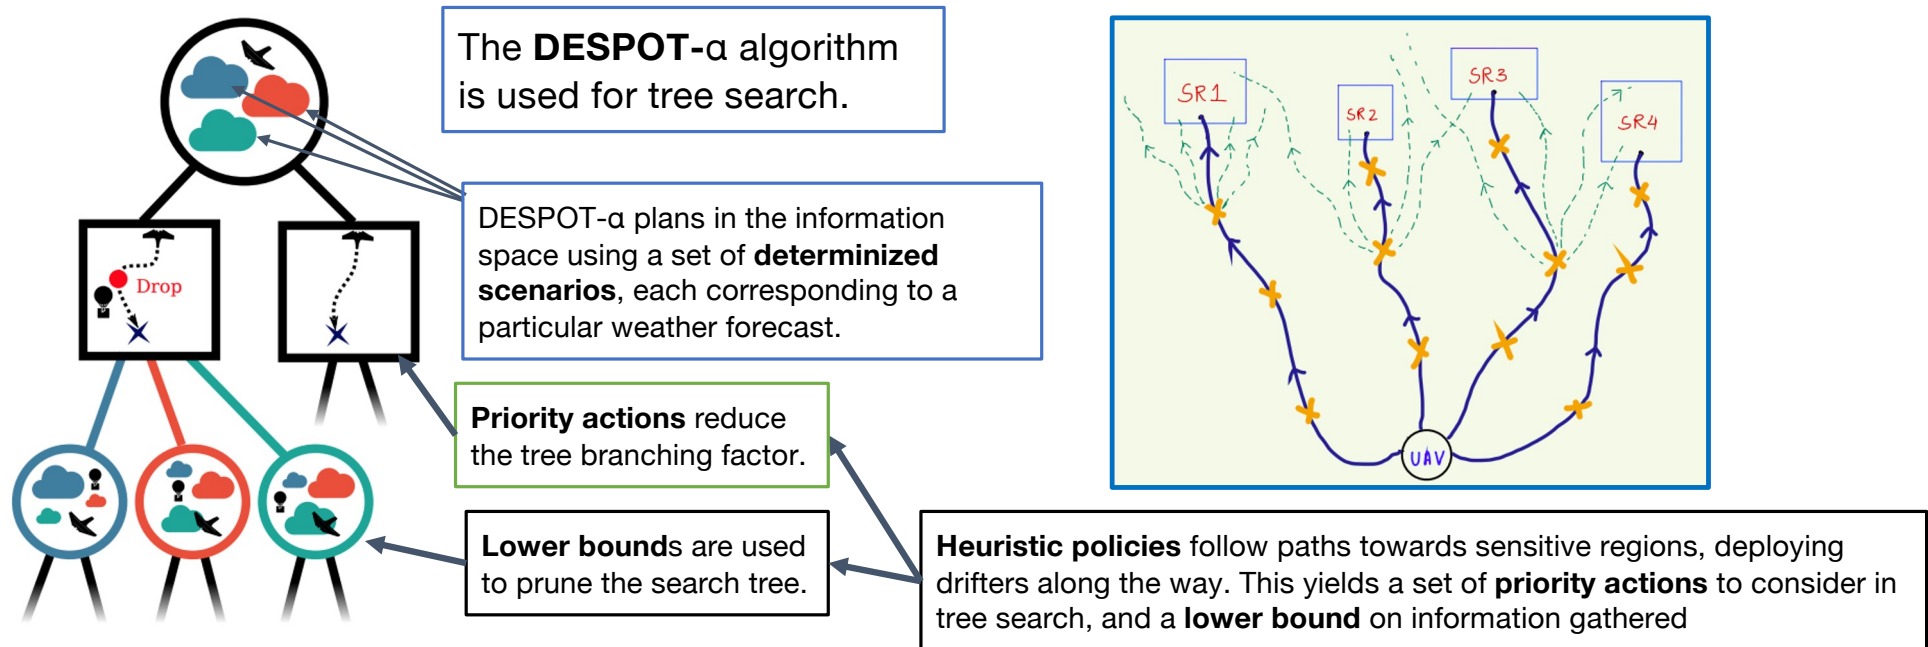

Observing System Simulation Experiments

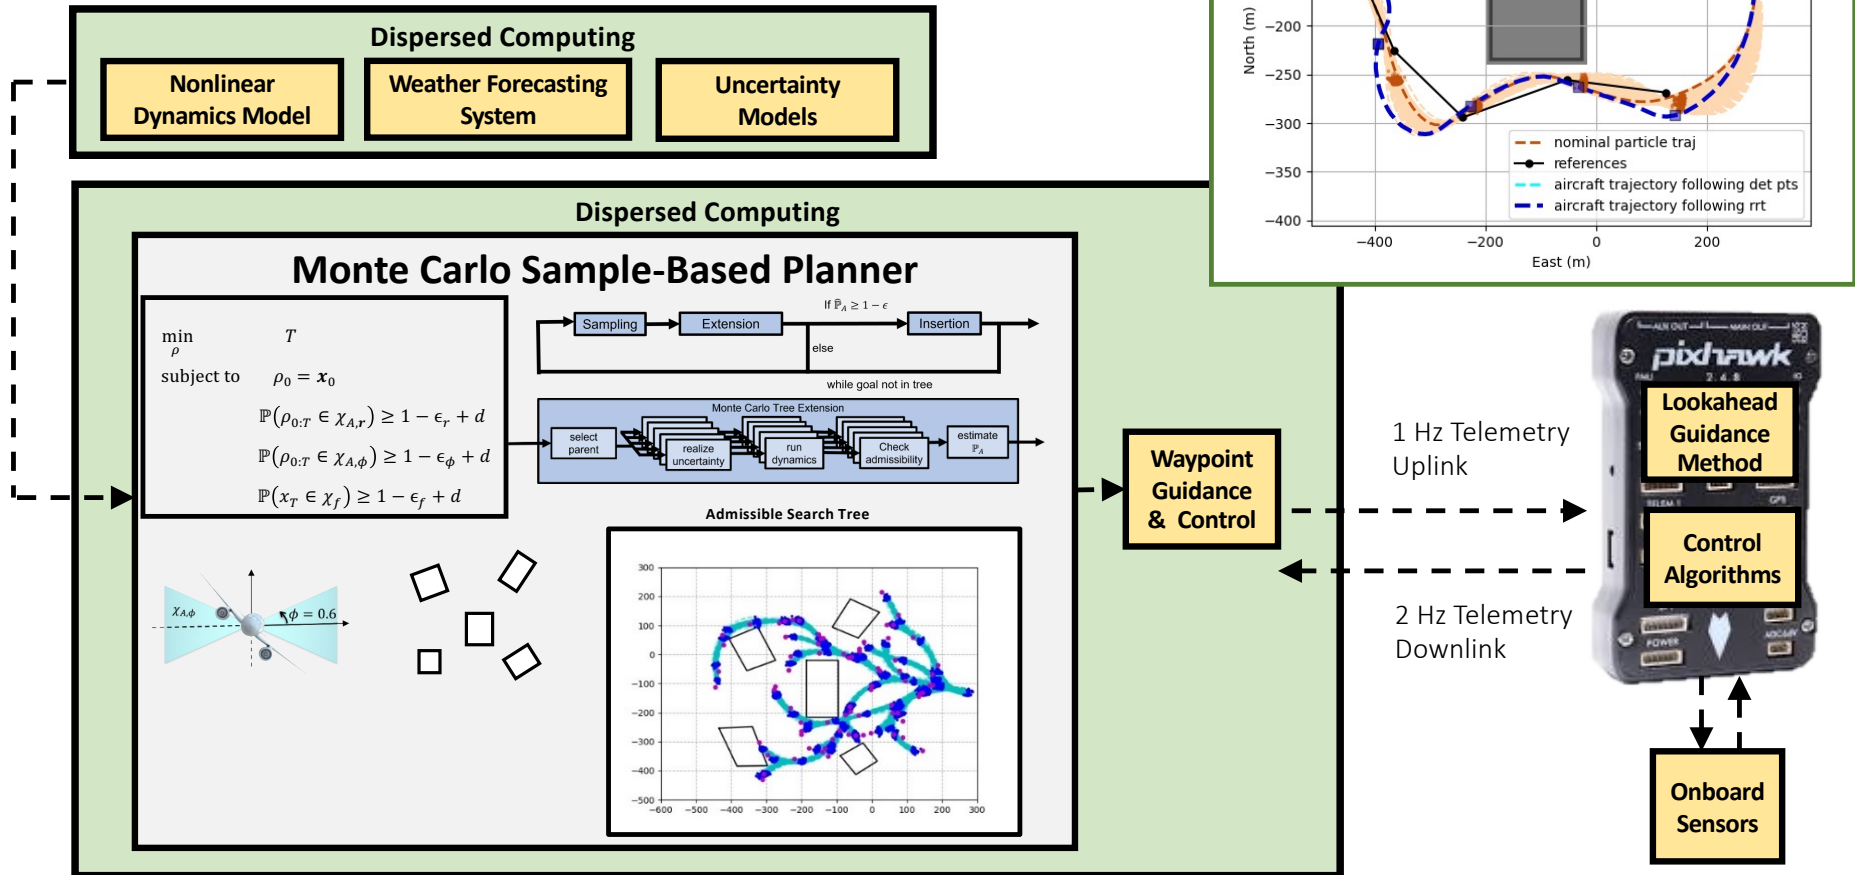

Information-Space Planning for ALD Deployment

GOAL: Plan feasible ALD deployment strategies to minimize atmosphere uncertainty

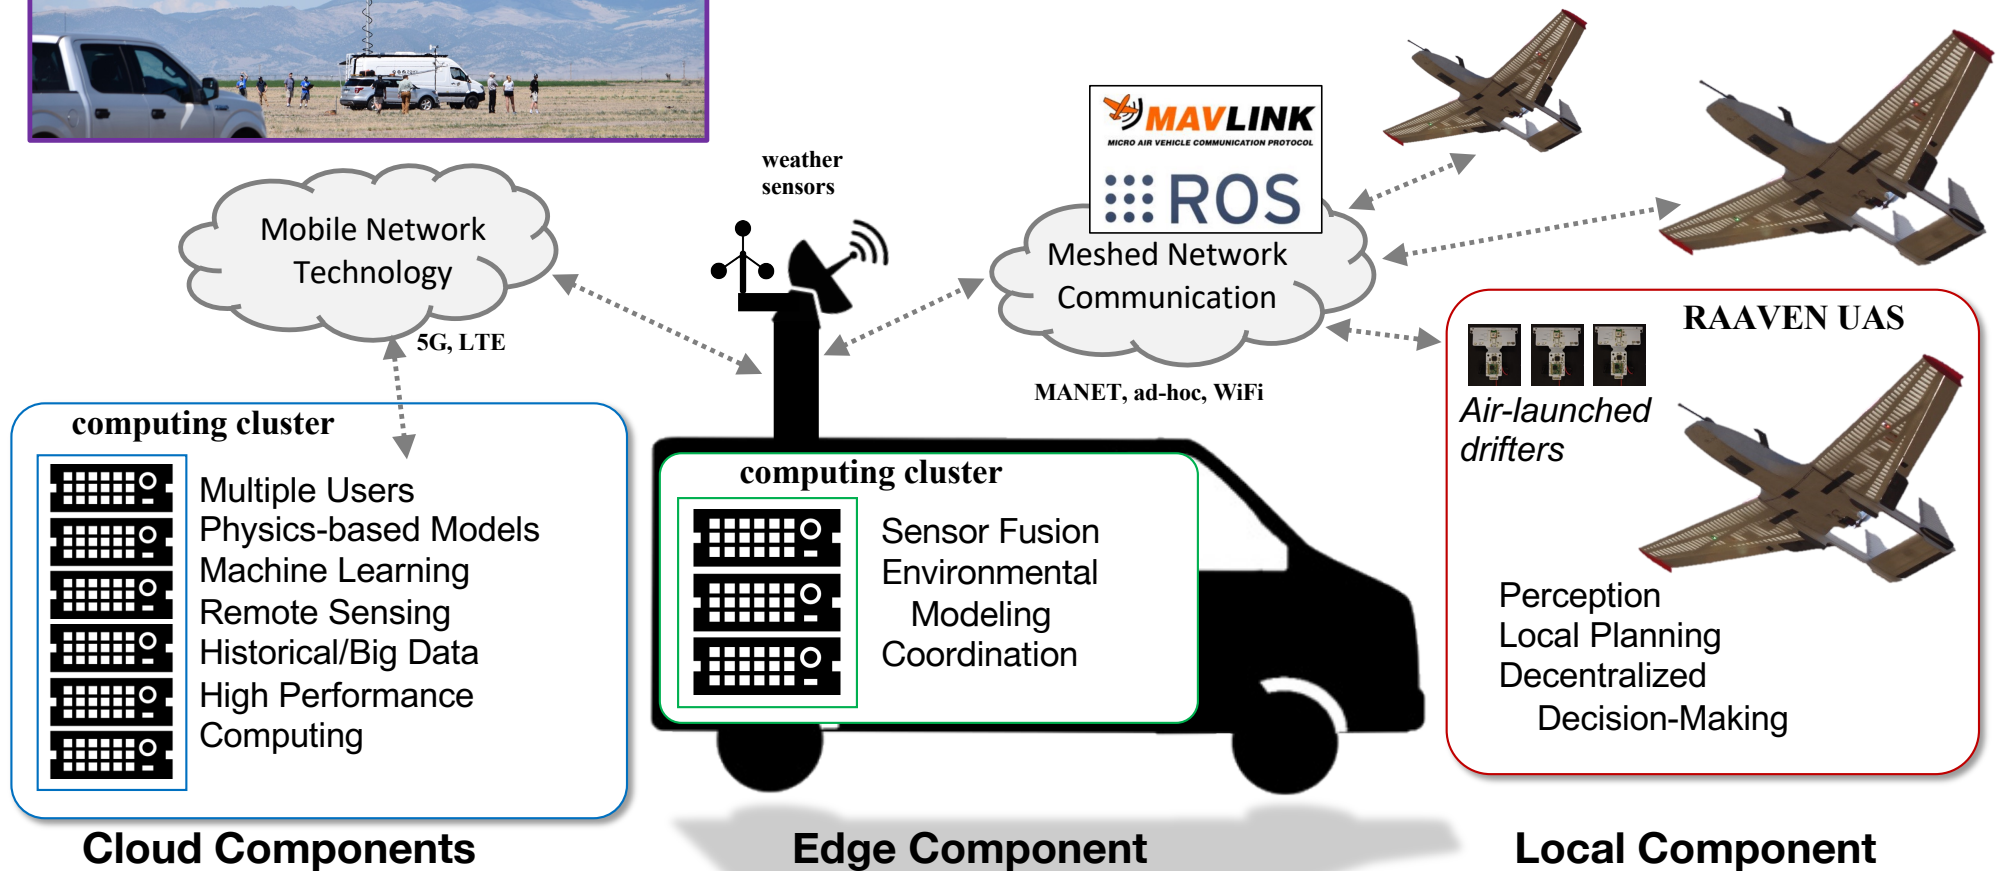

ρ - **POMDP tree search:** We use a modified version of the partially observable Markov decision process (POMDP) framework to formalise the goal as an optimization problem to be solved online with tree search.

Parallelizable Motion Planning in Uncertain Flow Fields

Innovative Integration: Dispersed Autonomy Architecture + Experimental Field Assessment

Thank You
