

Benchmarks for Reinforcement Learning in Mixed Autonomy Traffic Eugene Vinitsky^{1*}, Aboudy Kreidieh^{2*}, Luc Le Flem³, Nishant Kheterpal³, Kathy Jang³, Cathy Wu³, Fangyu Wu³, Richard Liaw³, Eric Liang³, Alexandre Bayen^{2,3,4} | UC Berkeley

Motivation

- 2019: Every car company rolls out **Automated Cruise** Control
- Steady appearance of mixed autonomy-traffic
- Opportunity to improve the roadways
- Mujoco/Atari benchmarks have hugely advanced RL research
- No existing benchmarks in mixed-autonomy traffic!
- Time wasted rebuilding traffic scenarios
- Impossible to compare control strategies

Results

Conclusions/Future Work

- Using deep reinforcement learning, we can train autonomous vehicles to improve traffic • We open source four new benchmarks in mixed autonomy traffic • Three benchmarks correspond to common traffic situations • AVs improve traffic metrics up to 100% in some benchmarks Increasing the fraction of AVs does not necessarily improve outcomes

- Future work: Benchmarks-v1
 - Generalization: Can we find one AV controller for many scenarios? **Decentralization:** how well can we do with multi-agent RL? **Scaling:** Can AVs optimize traffic at the city scale? Human comfort: Optimize w/ regard for passenger satisfaction
 - **Fairness:** Can RL find the social optimum without unfair penalties?
