2: Carnegie Mellon: <http://www.andrew.cmu.edu/user/bex/stories/welcome/>

Objective:

Demonstrate geometry-based trajectory generation methods for self-propelled millimeter-scale devices. Prototype optimized micron-scale devices. Integrate robotics and microfabrication systems to fundamentally change cyber-physical system design and control.

Challenge:

Integrate motion planning and mechanical design for microscale devices

Scientific Impact:

Develop cyber-physical system design process that informs the construction of mechanical prototypes via geometric modeling and optimal motion planning

Broader Impact – Society:

Establishes the foundation for novel medical device deployment. Enables non-invasive surgery, biosensing, targeted drug delivery

Broader Impact – Outreach:

- Implemented real-time, web-based control of Helmholtz Coils, devised workflow, and outlined user interface for public dissemination

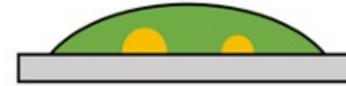

Photoresist on No. 1.5 glass coverslip

Peel PDMS template

Two-photon polymerization to create hemispheres

Templated assembly by selective removal of microspheres

Develop features

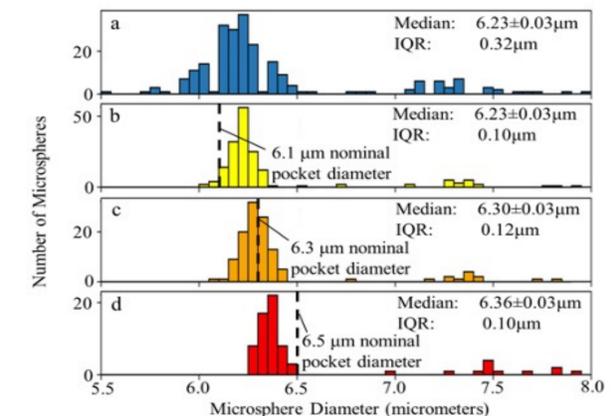

Connect microspheres with DNA nanotube solution

Mix and bake PDMS layer on positive topography

Wash and magnetically pull constructs from templates

Y3 Outcomes:

- Demonstrated magnetically actuated microswimmer constructed from DNA and microspheres in a hybrid top-down and bottom-up assembly technique that allows for submicron-level precision over microswimmer body construction
- Microscale features were fabricated via two-photon polymerization, from which polydimethylsiloxane templates were molded and used for selective removal to deposit microspheres of select size into the templates
- Published paper in JMES, "A customizable DNA and Microsphere-Based Magnetically-Actuated Microswimmer"
