# **Project Description and Goals**

The **goal** of this project is to develop a unified and **domain-agnostic** framework for designing secure and trustworthy **networked cyber-physical systems (NCPSs)** by leveraging on the synergies between the cyber, physical, and human realms.

- Thrust I: A blend of control and stochastic game techniques for developing new approaches to secure NCPSs against both cyber and physical threats.
- Thrust II: Novel behavioral game-theoretic frameworks for NCPS security that incorporate notions of bounded rationality in human decision making.
- Thrust III: Implementation over a cross-institutional smart grid testbed for validation and evaluation.

3) Behavioral experiments with pen testers

# **Recent Results**

### **Prospect Theory for Secure Delivery Drones** □ Network interdiction game:

- Path selection strategy (mixed) vs. interdiction strategy (mixed).
- Goal: minimize vs. maximize expected delivery time.

## □ Prospect Theory (PT) vs. Classical Game Theory (CGT):

- E.g. emergency medicine delivery, amazon prime air's 30 min,...
- Disparate perceptions of risks, prob. of successful attack, (weighting effect).

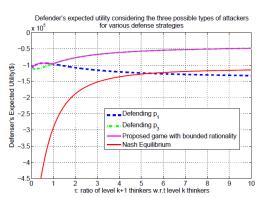

#### o Level O: attacks randomly. • Expected delivery time valued w.r.t target time, R (framing effect), Level 1: attacks line with highest flow. cascading failures. Optimal path selection strategy under CGT and PT = PT: γ=0.1 O: origin, D: Destination PT: γ=0.5 Graph nodes: danger points PT: γ=0.9 7 8 9 10 11 12 13 14 15 16 17 18 4 5 6 Path (h) t17 0 Optimal interdiction strategy under CGT and PT t<sub>13</sub> 1 t<sub>14</sub> PT`v=0 1 PT: γ=0.5

# **Propagation of Threats in NCPS with Smart Grid Application**

### **Cognitive Hierarchy Theory** and Hypergames:

- Higher level thinkers:
- Better system knowledge.
- o Better computational capabilities.
- Wider attack space.
- Multiple levels of thinking.

• Level 2: attacks node triggering worst Experimental Analysis

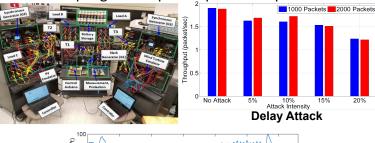

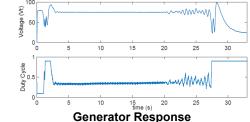

# Impact of cyber attacks on physical NCPS

- Two identical hardware-based IEEE 9-bus testbeds at Temple and FIU
- DoS, packet drop, message integrity, and delay attacks tested on the two testbeds.

### Cyber attacks in grid tied generator control

- Hold the last received data in the event of packet drop.
- Stable if packet drop probability < threshold.</p>
- Faster sampling rate improves packet drop threshold.
