Improving Robot Learning from Feedback and Demonstration using Natural Language

IIS-1925082, 9/2019 - 8/2022
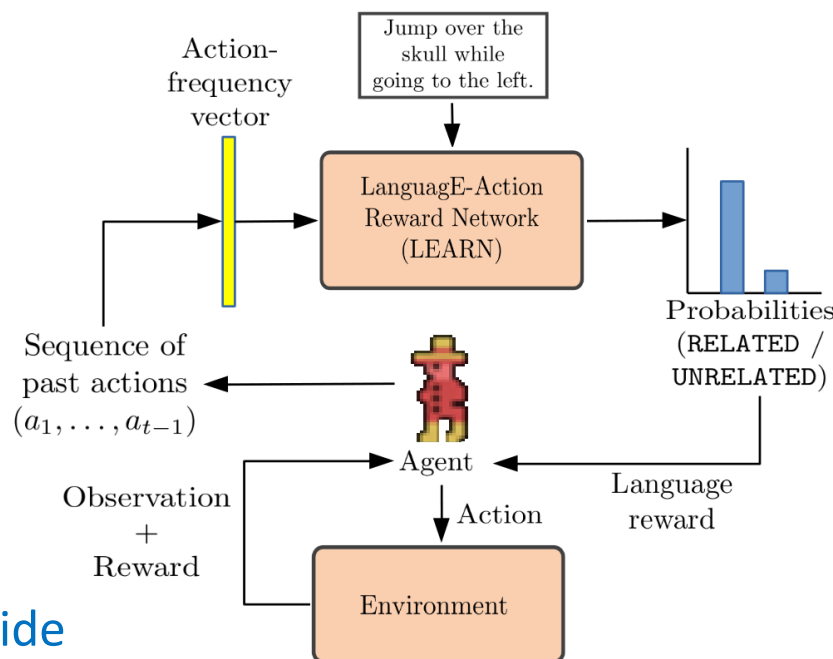

Raymond Mooney, Scott Niekum, & Peter Stone, University of Texas at Austin

Challenge

- Use natural language narration to aid robot learning from feedback and demonstration.

Solution

- Use natural language as supervised attention to improve generalization.

- Use natural language to provide intermediate shaping rewards for deep reinforcement learning.

Scientific Impact

- Novel methods for using natural language to improve task learning from limited training data.

Broader Impact

- Allow novice users to naturally and effectively train robots to perform novel tasks.

- Improve education for grad, ugrad (FRI), and HS (First Bytes) students.

- Measure improved learning rate from using natural language narration.
