UMBC

Collaboration requires communication

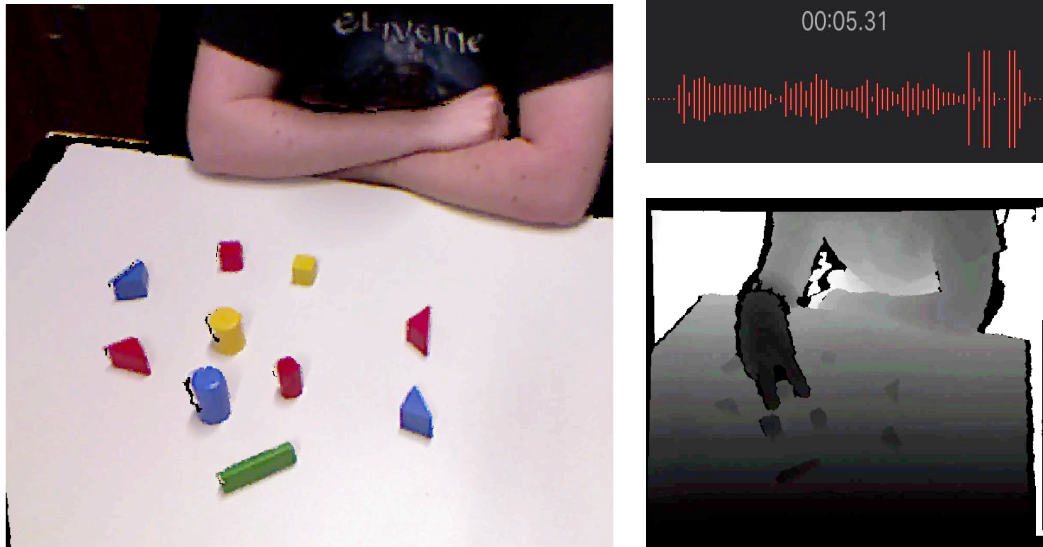

- Natural language for HRI
 - Natural, intuitive, and adaptable
- Teach, direct, and customize environment and teammates
- Language in the world = grounded language
 - NLP \neq vision \neq robotics
 - Grounded percepts and actions

Jointly modeling correspondences

"Three cylinders; a red cylinder, a blue cylinder and a yellow cylinder."

"These are the blue ones"

Language model
 $\lambda x.newclass_0-blue(x)$

Grounded Query

Perceptual world model

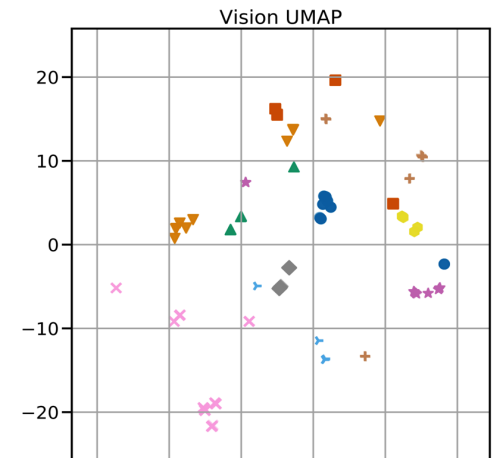

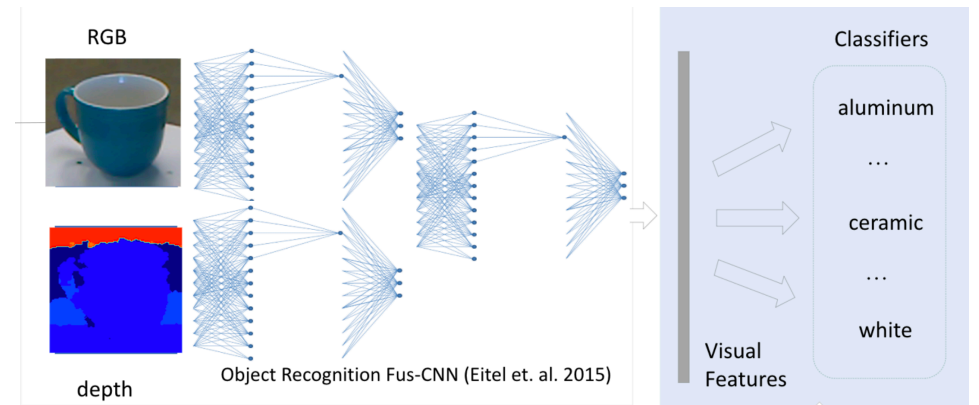

$$\underbrace{P(G, z, w | x, O)}_{\text{Joint Probability}} = \underbrace{P(z | x)}_{\text{Parsing Model}} \prod_{o \in O} \prod_{c \in C} \underbrace{P(w_{o,c} | o)}_{\text{Perceptual Model}} \underbrace{P(G | z, w)}_{\text{Grounding Query}}$$

The data problem(s)

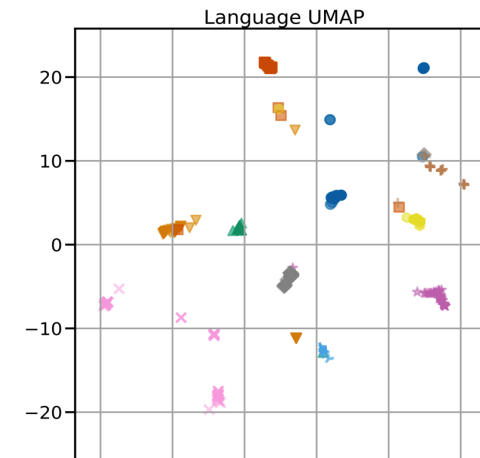

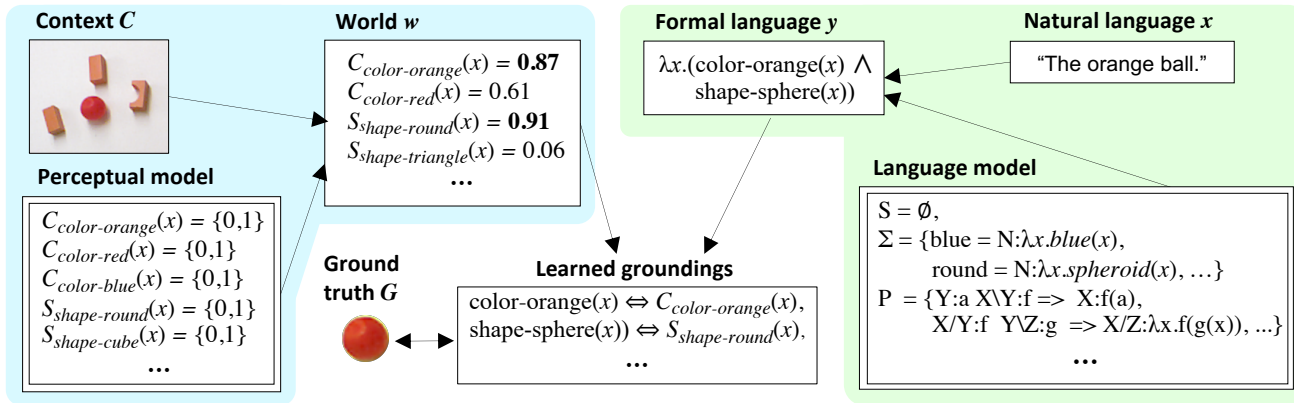

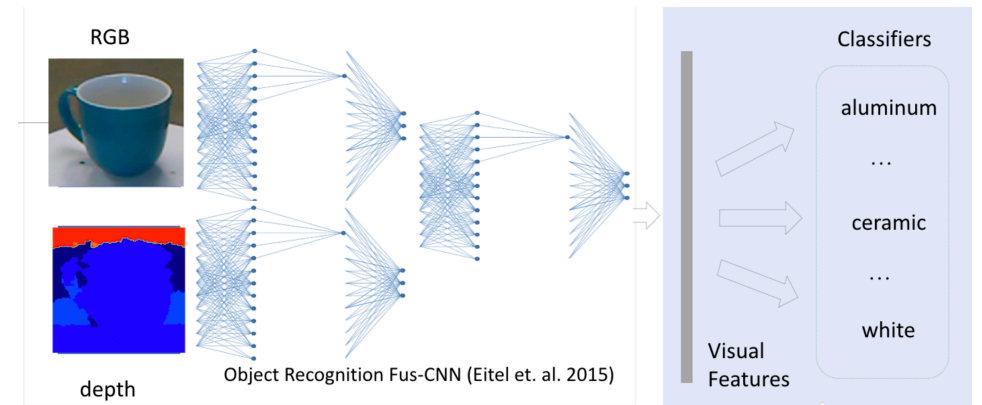

- Formalism is model-agnostic
- Applicable to arbitrary modalities
 - As long as you have language
- But that makes it data hungry

The data problem(s)

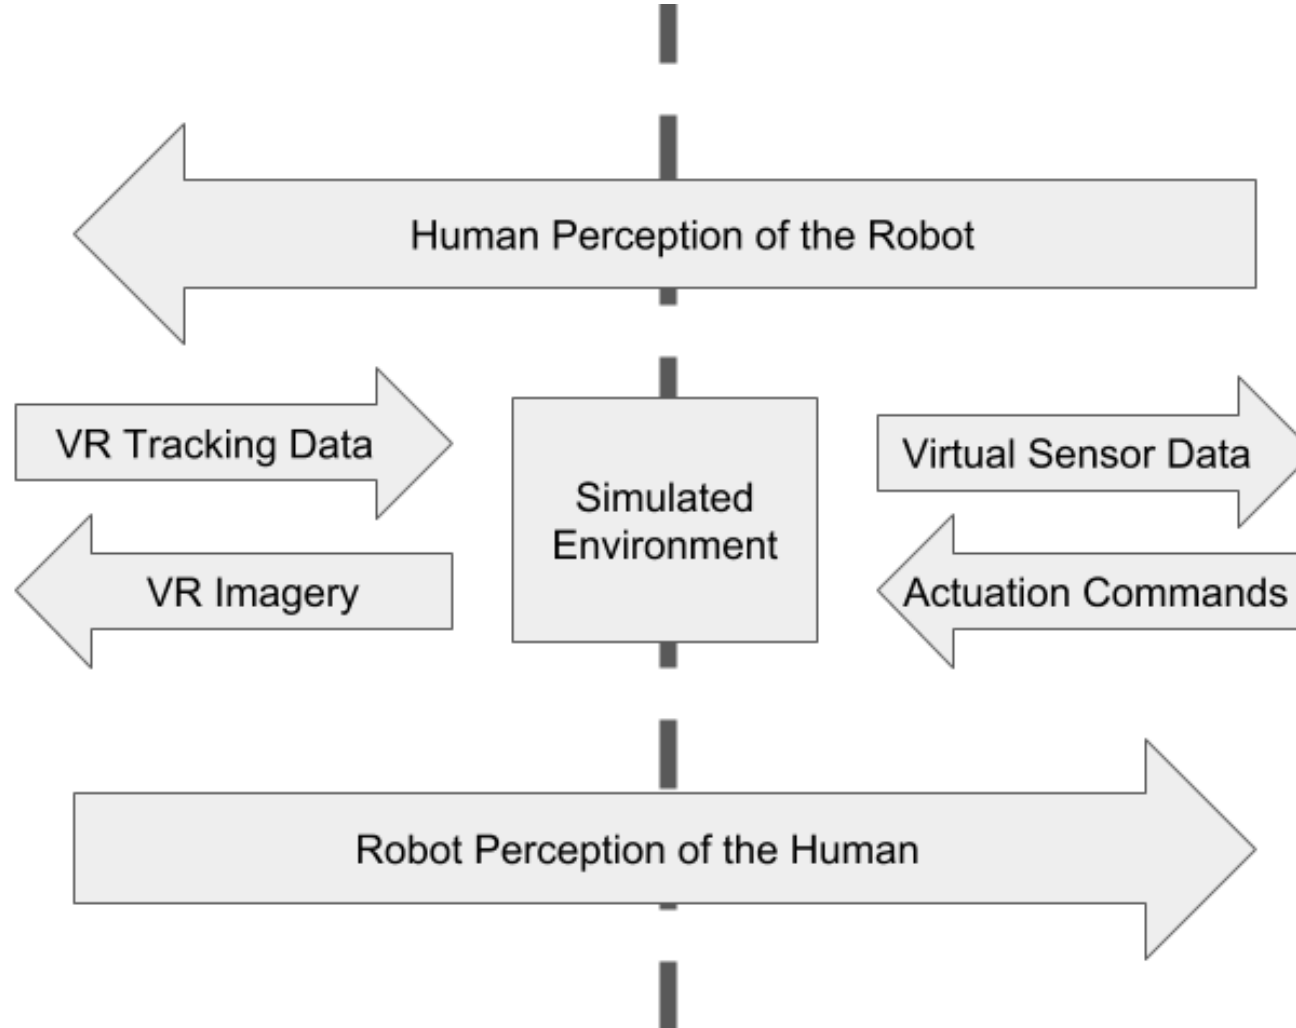

- Research platforms in large- n trials
- Collecting data from different settings
 - Getting robots & participants there, getting permission to be there, IRB, ...
- Anything involving people

Sim2Real HRI, from the robot side

Training, simulating, testing

Instructing partner

Collect participant speech, gesture, and head posture

Robot's perceptual inputs

Saved scenario can be replayed with different sensors, noise model, ...

Real-world transfer

Perform tasks using domain adaptation for additional learning

Photogrammetry: 3D models

π^2 : Participant interaction space

Scenario development and testing

- Fast experiment prototyping
- High-resolution data collection
