- "Cyber-Physical Systems (CPS) are integrations of **computation, networking, and physical** processes. **Embedded** computers and networks monitor and control the physical processes, with feedback loops where **physical processes affect computations and vice versa**...The technology builds on the older (but still very young) discipline of embedded systems, computers and software embedded in devices whose principle mission is not computation, such as cars, toys, medical devices, and scientific instruments."

# CDC 2012 - Papers on “Embedded Systems”

---

# CDC 2012 - Papers on “Real-time Systems”

---

# Embedded Optimization (Optimal Control / Estimation / DSP) for Cyber-Physical Systems

# Applications for Embedded Optimization (Optimal Control / Estimation / DSP)

# Computing and Cyber-Physical Systems

---

“All too often, today’s students use **laptop** [or **desktop**] computers to perform their computing, which shields them from dealing with any of the physical **constraints** they will face in the **real world**. This approach is akin to **trying to learn skiing while standing comfortably in the après ski lounge.**”

Wolf, Cyber-Physical Systems, *Computer*, 2009.

# Challenges for Cyber-Physical Systems

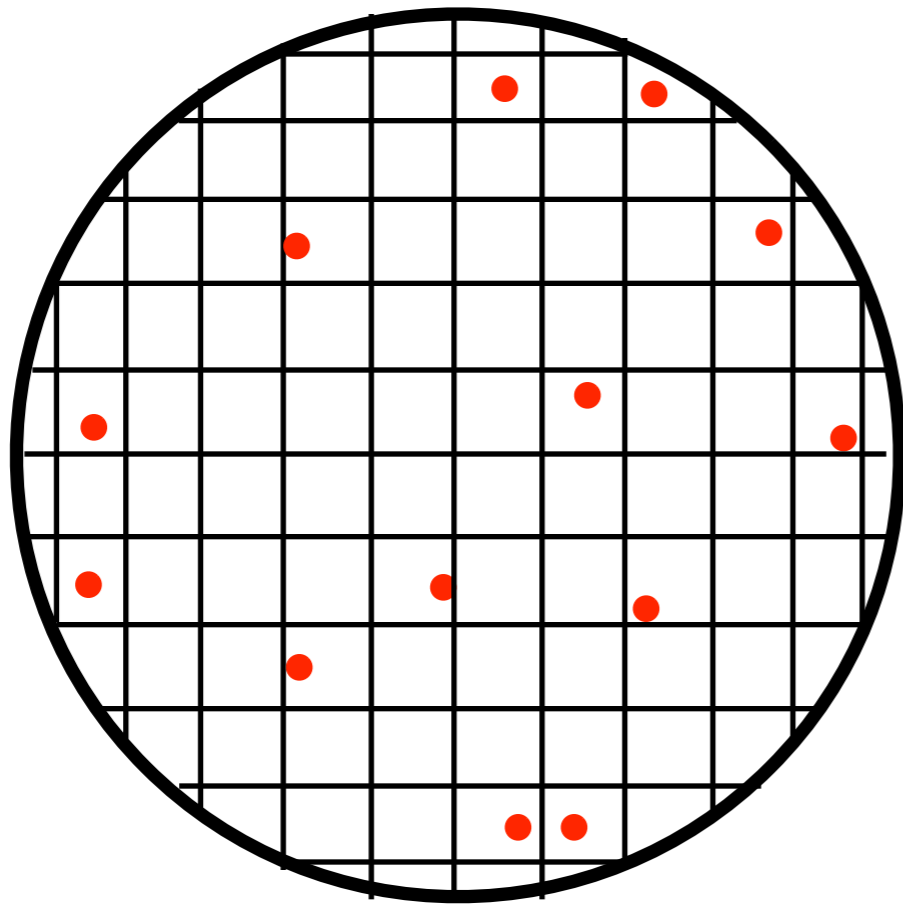

- Cost
- Energy
- Speed
- Reliability
- Predictability / real-time (fast is *not* equal to real-time)

**Number representation** (e.g. fixed/floating-point, #bits)  
has a **major** impact on the design

# Size is Very Important in Microprocessor Design

---

Die area = 1  
Working = 64

Die area = 4  
Working = 4

$$\text{Cost per die} = f(\text{area}^x), \quad x \in [2, 4]$$

# Computational Resources for an Adder

---

Xilinx Virtex-7 XT 1140 FPGA:

<b>Number representation</b>	<b>Registers/Flip-Flops (FFs)</b>	<b>Latency/delay (clock cycles)</b>
double floating-point 52-bit mantissa	1046	14
single floating-point 23-bit mantissa	557	11
fixed-point 53 bits	53	1
fixed-point 24 bits	24	1

**Cheap** and **low power** processors often only have **fixed-point**

# Dynamic Optimization

---

$$\min_{x(\cdot), u(\cdot), p} J(y(\cdot), x(\cdot), u(\cdot), p)$$

$$F(y(t), \dot{x}(t), x(t), u(t), p, t) = 0, \quad \forall t \in [t_0, t_f)$$

$$G(y(t), \dot{x}(t), x(t), u(t), p, t) \leq 0, \quad \forall t \in [t_0, t_f)$$

Discretized and approximated by finite-dimensional NLP:

$$\min_{\theta} V(\theta)$$

$$f(\theta) = 0$$

$$g(\theta) \leq 0$$

$$\theta \in \mathbb{R}^n, \quad f : \mathbb{R}^n \rightarrow \mathbb{R}^m, \quad g : \mathbb{R}^n \rightarrow \mathbb{R}^p$$

# Fixed-Point Arithmetic

# Floating-Point Arithmetic

---

# Fixed-Point Arithmetic

---

# Challenges for Fixed-Point Arithmetic

---

- Number of bits for **integer** and fractional part?
  - Determine **worst-case peak** values
  - Optimization algorithms are **nonlinear** and **recursive**
- **Search direction** most computationally critical part:
$$A\xi = b$$
- **Iterative linear solvers** preferred: CG, MINRES, GMRES

# Lanczos Algorithm (Kernel of CG/MINRES)

---

$$Q_i^T A Q_i = T_i := \begin{bmatrix} \alpha_1 & \beta_1 & & 0 \\ \beta_1 & \alpha_2 & \ddots & \\ & \ddots & \ddots & \beta_{i-1} \\ 0 & & \beta_{i-1} & \alpha_i \end{bmatrix}$$

Given  $q_1$  such that  $\|q_1\|_2 = 1$  and an initial value  $\beta_0 := 1$

**for**  $i = 1$  to  $i_{max}$  **do**

1.  $q_i \leftarrow \frac{q_i}{\beta_{i-1}}$

2.  $z_i \leftarrow A q_i$

3.  $\alpha_i \leftarrow q_i^T z_i$

4.  $q_{i+1} \leftarrow z_i - \alpha q_i - \beta_{i-1} q_{i-1}$

5.  $\beta_i \leftarrow \|q_{i+1}\|_2$

**end for**

# Lanczos Algorithm (Kernel of CG/MINRES)

---

$$Q_i^T A Q_i = T_i := \begin{bmatrix} \alpha_1 & \beta_1 & & 0 \\ \beta_1 & \alpha_2 & \ddots & \\ & \ddots & \ddots & \beta_{i-1} \\ 0 & & \beta_{i-1} & \alpha_i \end{bmatrix}$$

Given  $q_1$  such that  $\|q_1\|_2 = 1$  and an initial value  $\beta_0 := 1$

4.  $q_{i+1} \leftarrow z_i - \alpha q_i - \beta_{i-1} q_{i-1}$

5.  $\beta_i \leftarrow \|q_{i+1}\|_2$

**end for**

# Evolution of Variables in Primal-dual Interior Point

Optimal control of a Boeing 747

# On-line Diagonal Preconditioner / Scaler

---

$$A\xi = \mathbf{b}, \quad A = A'$$

$$S_{kk} := \sum_{j=1}^N |A_{kj}| \quad (\text{1-norm of row } k)$$

$$S^{-\frac{1}{2}} A S^{-\frac{1}{2}} \psi = S^{-\frac{1}{2}} \mathbf{b} \Leftrightarrow \hat{A} \psi = \hat{\mathbf{b}} \Rightarrow \rho(\hat{A}) \leq 1$$

$$\xi = S^{-\frac{1}{2}} \psi$$

## **Theorem (Avoiding overflow in fixed-point)**

All variables in Lanczos algorithm are between -2 and 2

*Proof:* Proc. IEEE Conference on Decision and Control 2012

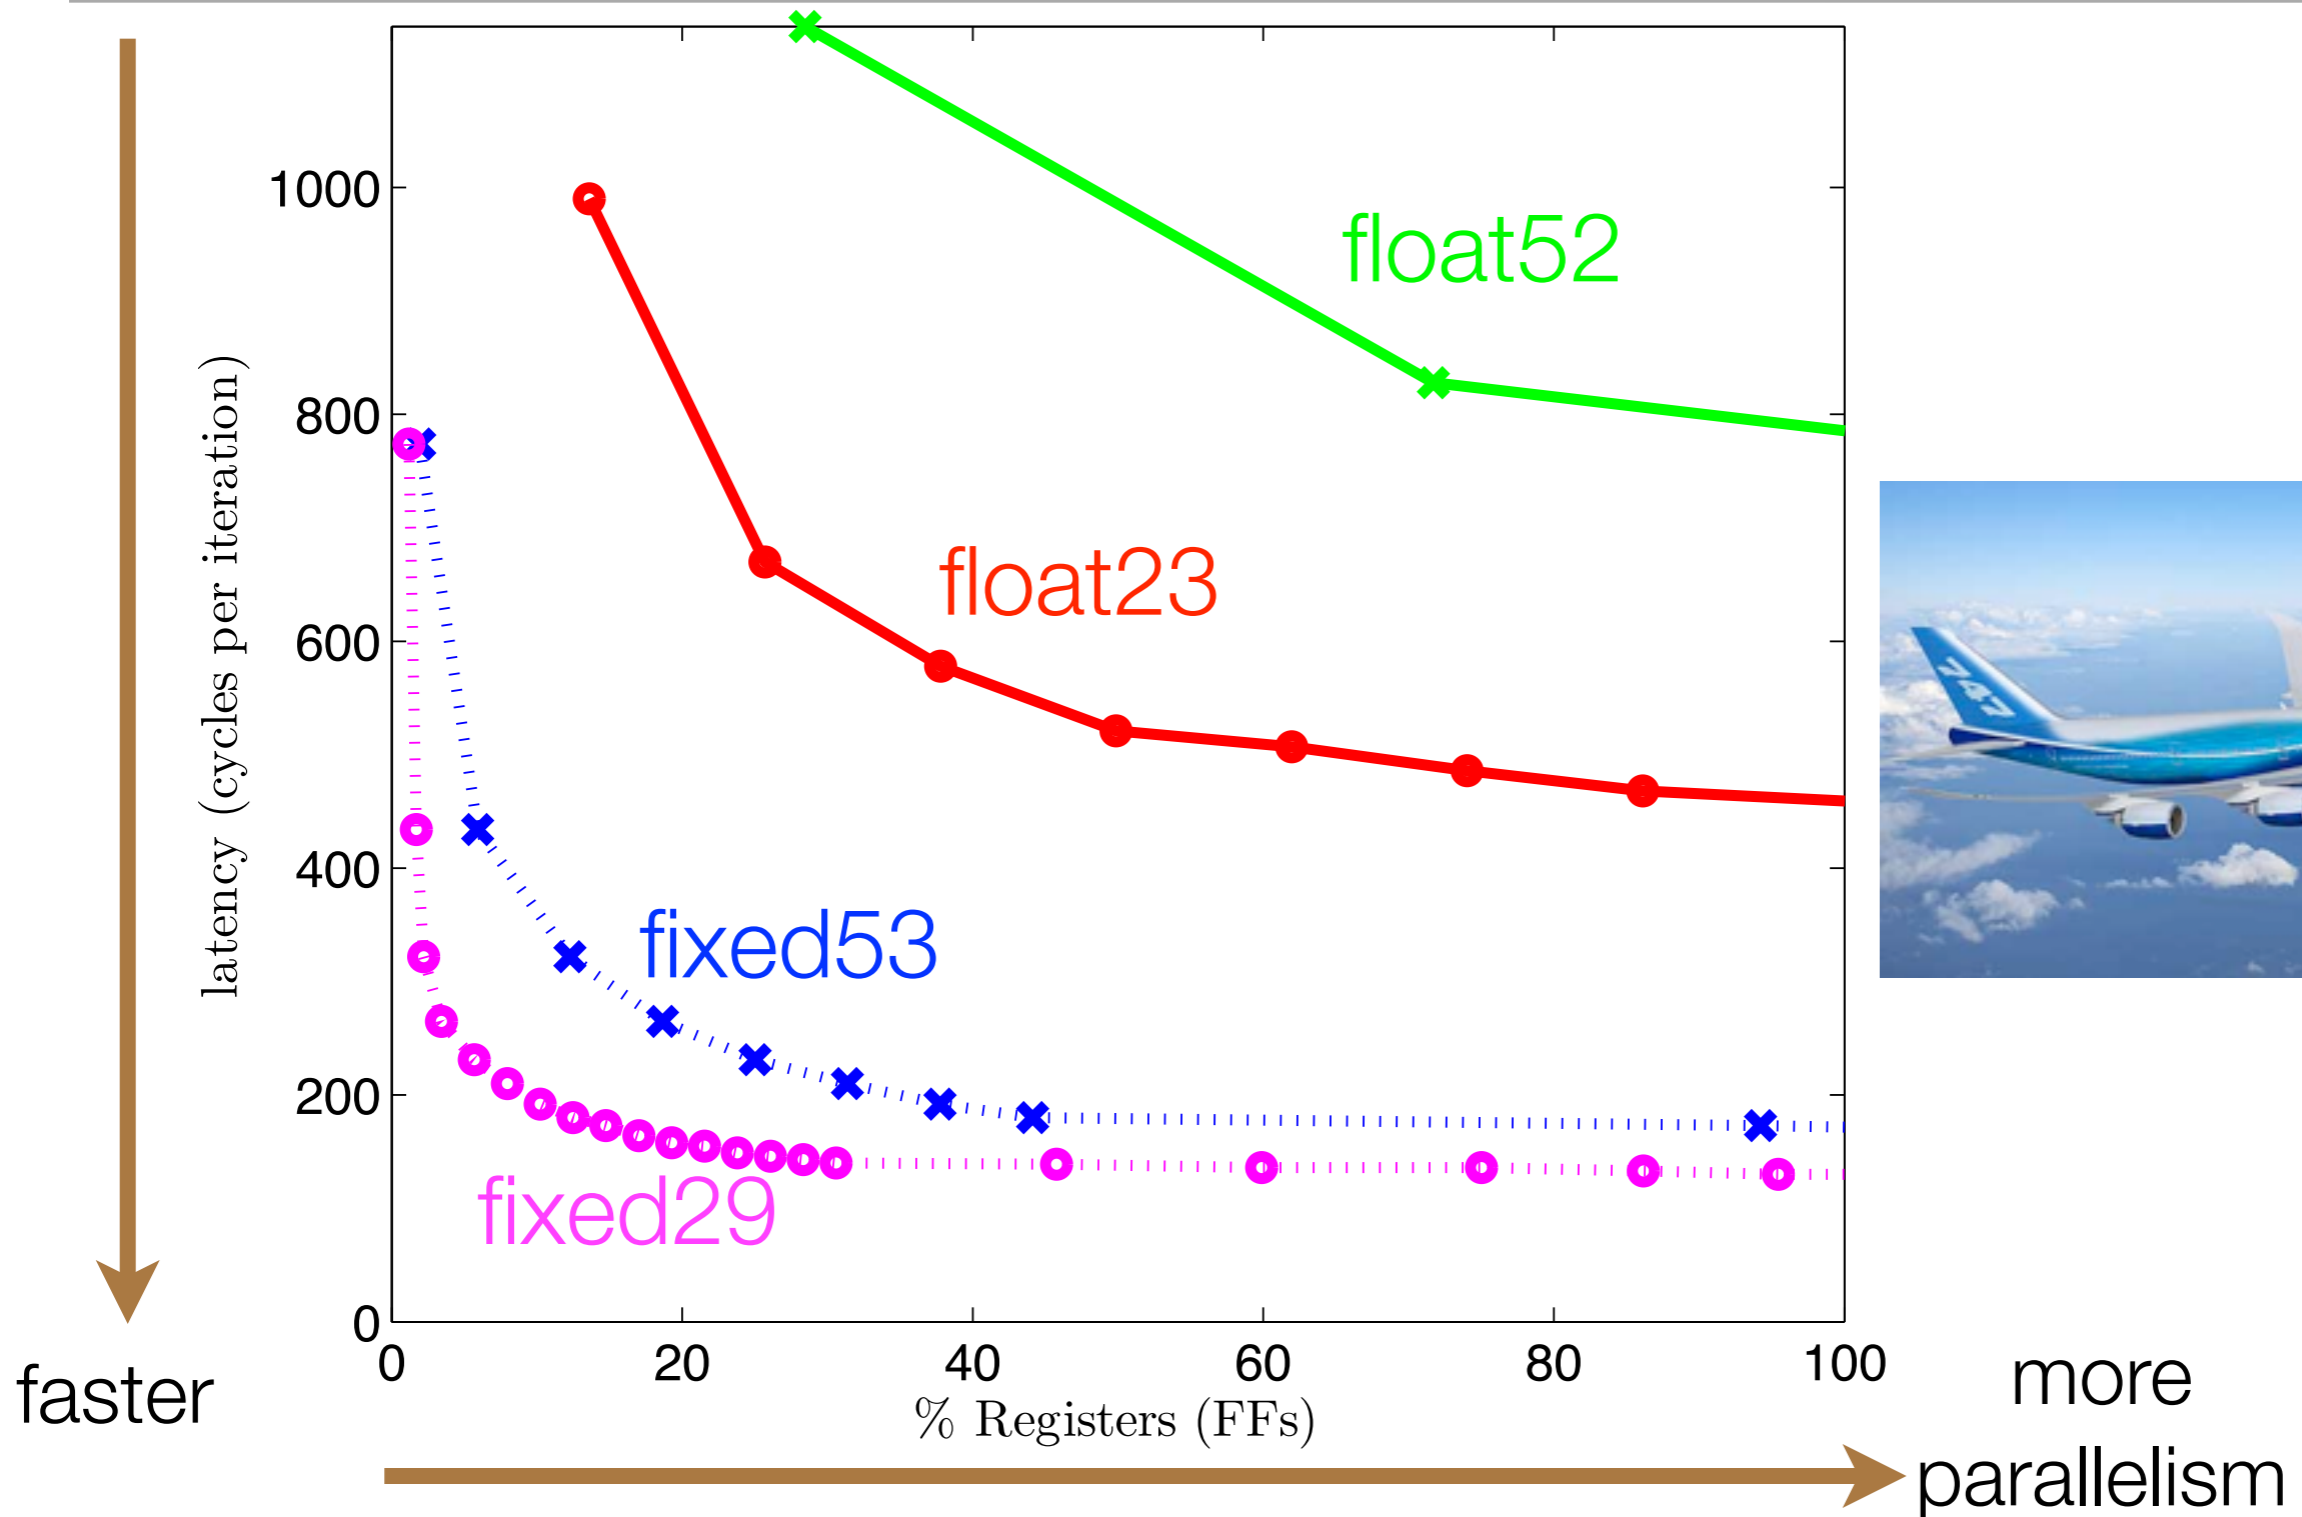

# Evolution of Variables in Primal-dual Interior Point

Optimal control of a Boeing 747

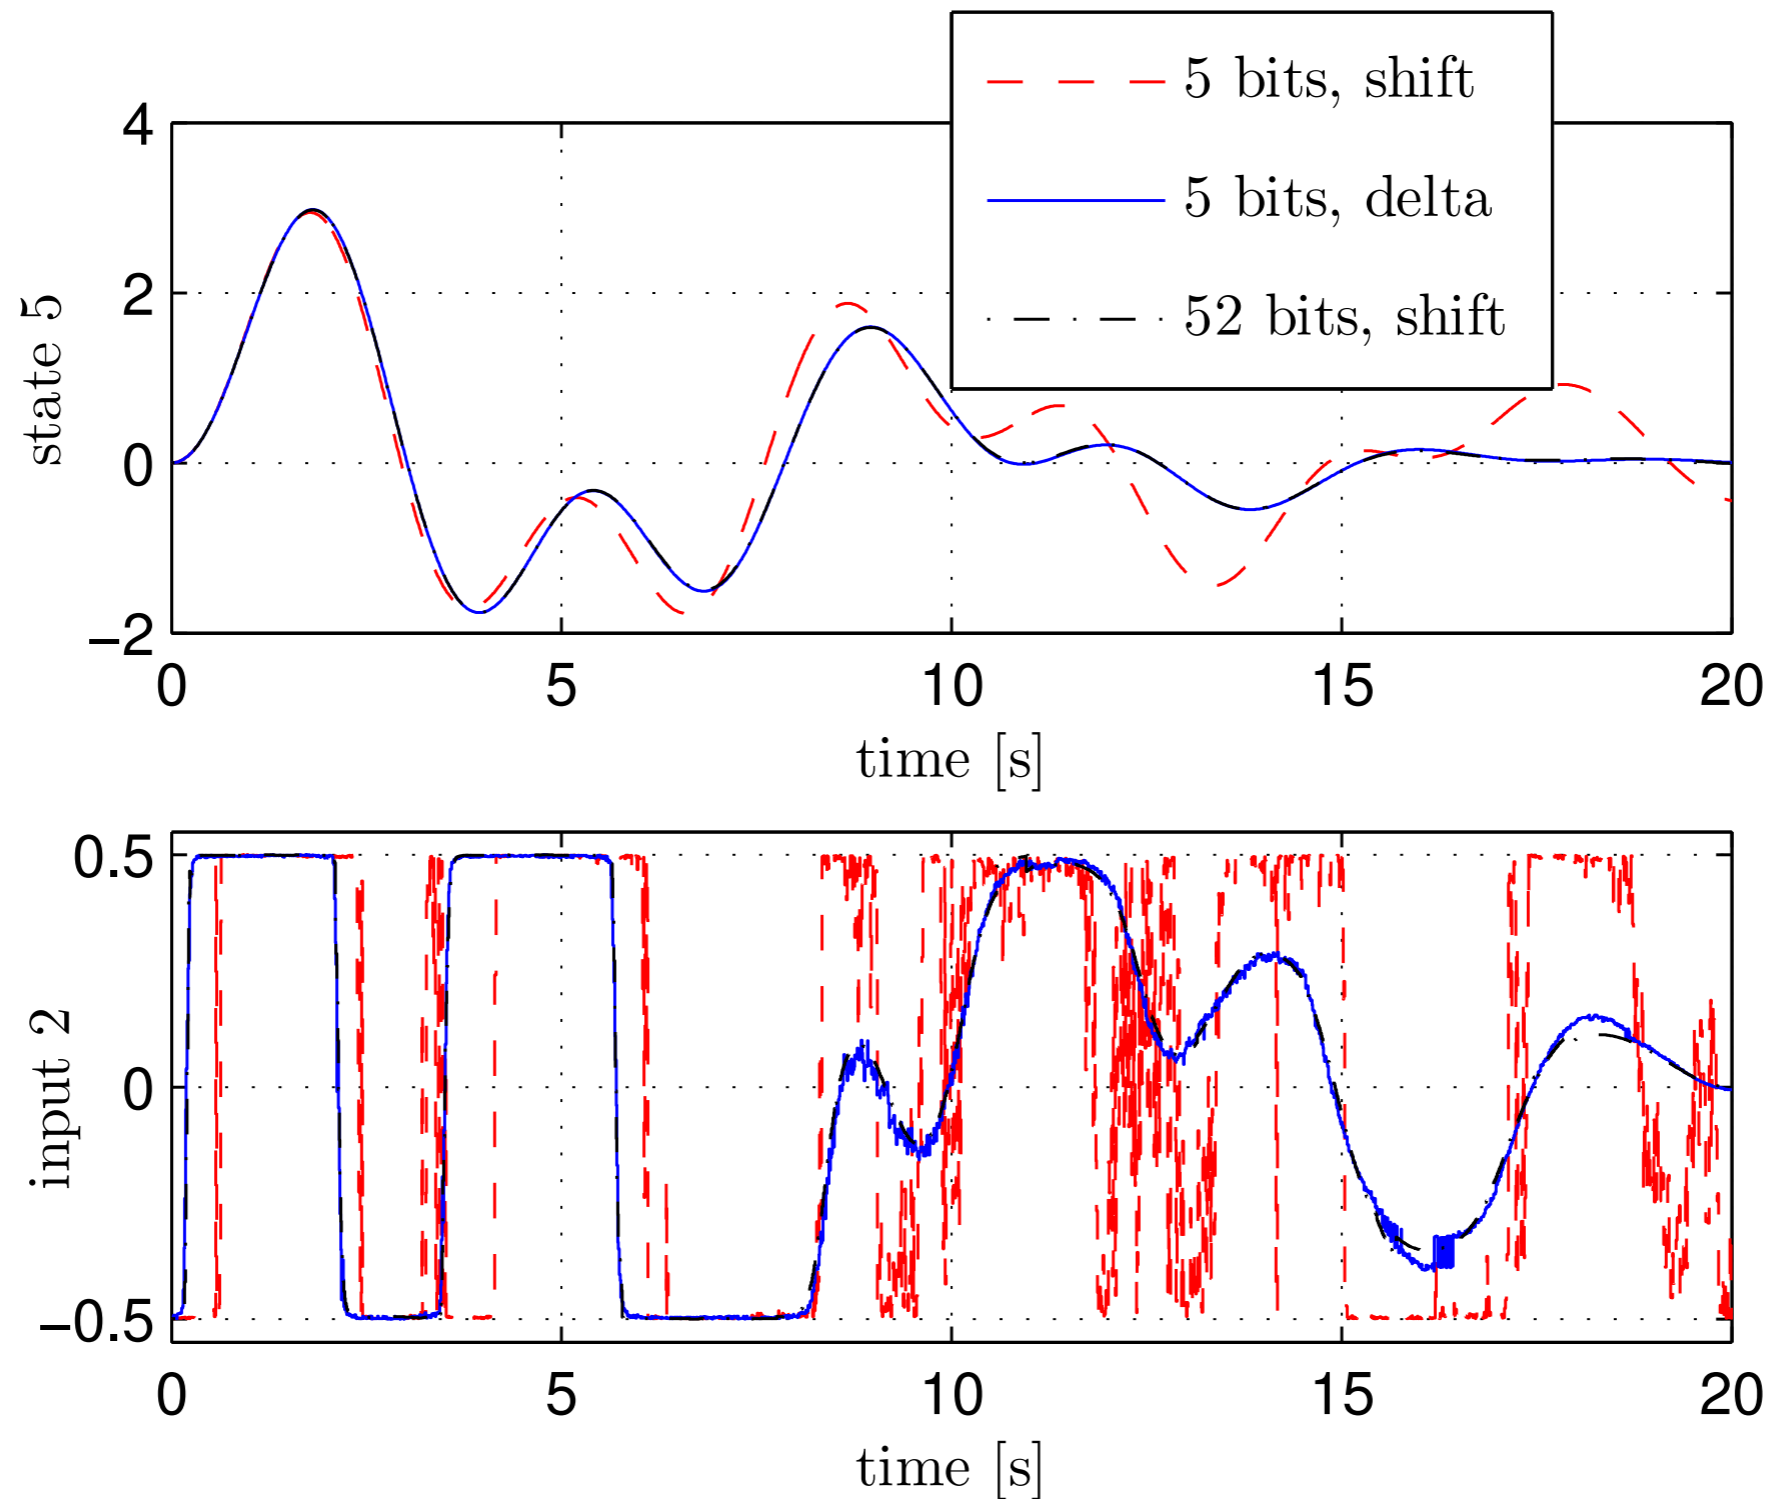

# Trade-offs on an FPGA (same accuracy)

Xilinx Virtex-7 XT 1140 with matrices from the optimal control of a Boeing 747

# Low-Precision Arithmetic

# Optimal Control in Low Precision Arithmetic

Mass-spring system with 3 masses (6 states) and 2 inputs, sample period = 10ms

# Sampled-data Representation in Shift Form

---

$$\dot{x}(t) = A_c x(t) + B_c u(t)$$

Sample period  $h$  and piecewise constant input (ZOH):

$$u(t) = u(kh) =: u_k, \quad \forall t \in [kh, kh + h)$$

Exact solution/discrete-time model to compute  $x_k := x(kh)$

$$x_{k+1} = A_s x_k + B_s u_k$$

$$A_s := e^{A_c h} = I + A_c h + \frac{(A_c h)^2}{2!} + \frac{(A_c h)^3}{3!} + \dots$$

$$\lim_{\|A_c h\| \rightarrow 0} A_s = I, \quad \lim_{\|A_c h\| \rightarrow 0} B_s = 0$$

# Sampled-data Representation in Shift Form

$$\theta := [u'_0 \quad \delta'_0 \quad x'_1 \quad u'_1 \quad \delta'_1 \quad x'_2 \quad \cdots \quad u'_{N-1} \quad \delta'_{N-1} \quad x'_N]'$$

subject to

$$x_0 = \hat{x},$$

$$\delta_k = A_{\delta} x_k + B_{\delta} u_k, \quad \forall k \in \{0, 1, \dots, N-1\}$$

$$x_{k+1} = x_k + h\delta_k, \quad \forall k \in \{0, 1, \dots, N-1\}$$

$$Jx_k + Eu_k \leq d, \quad \forall k \in \{0, 1, \dots, N-1\}$$

# Solving the Optimization Problem

---

- Solve linearized **KKT system** (Rao, Wright, Rawlings; JOTA, 1998):

$$A\xi = b$$

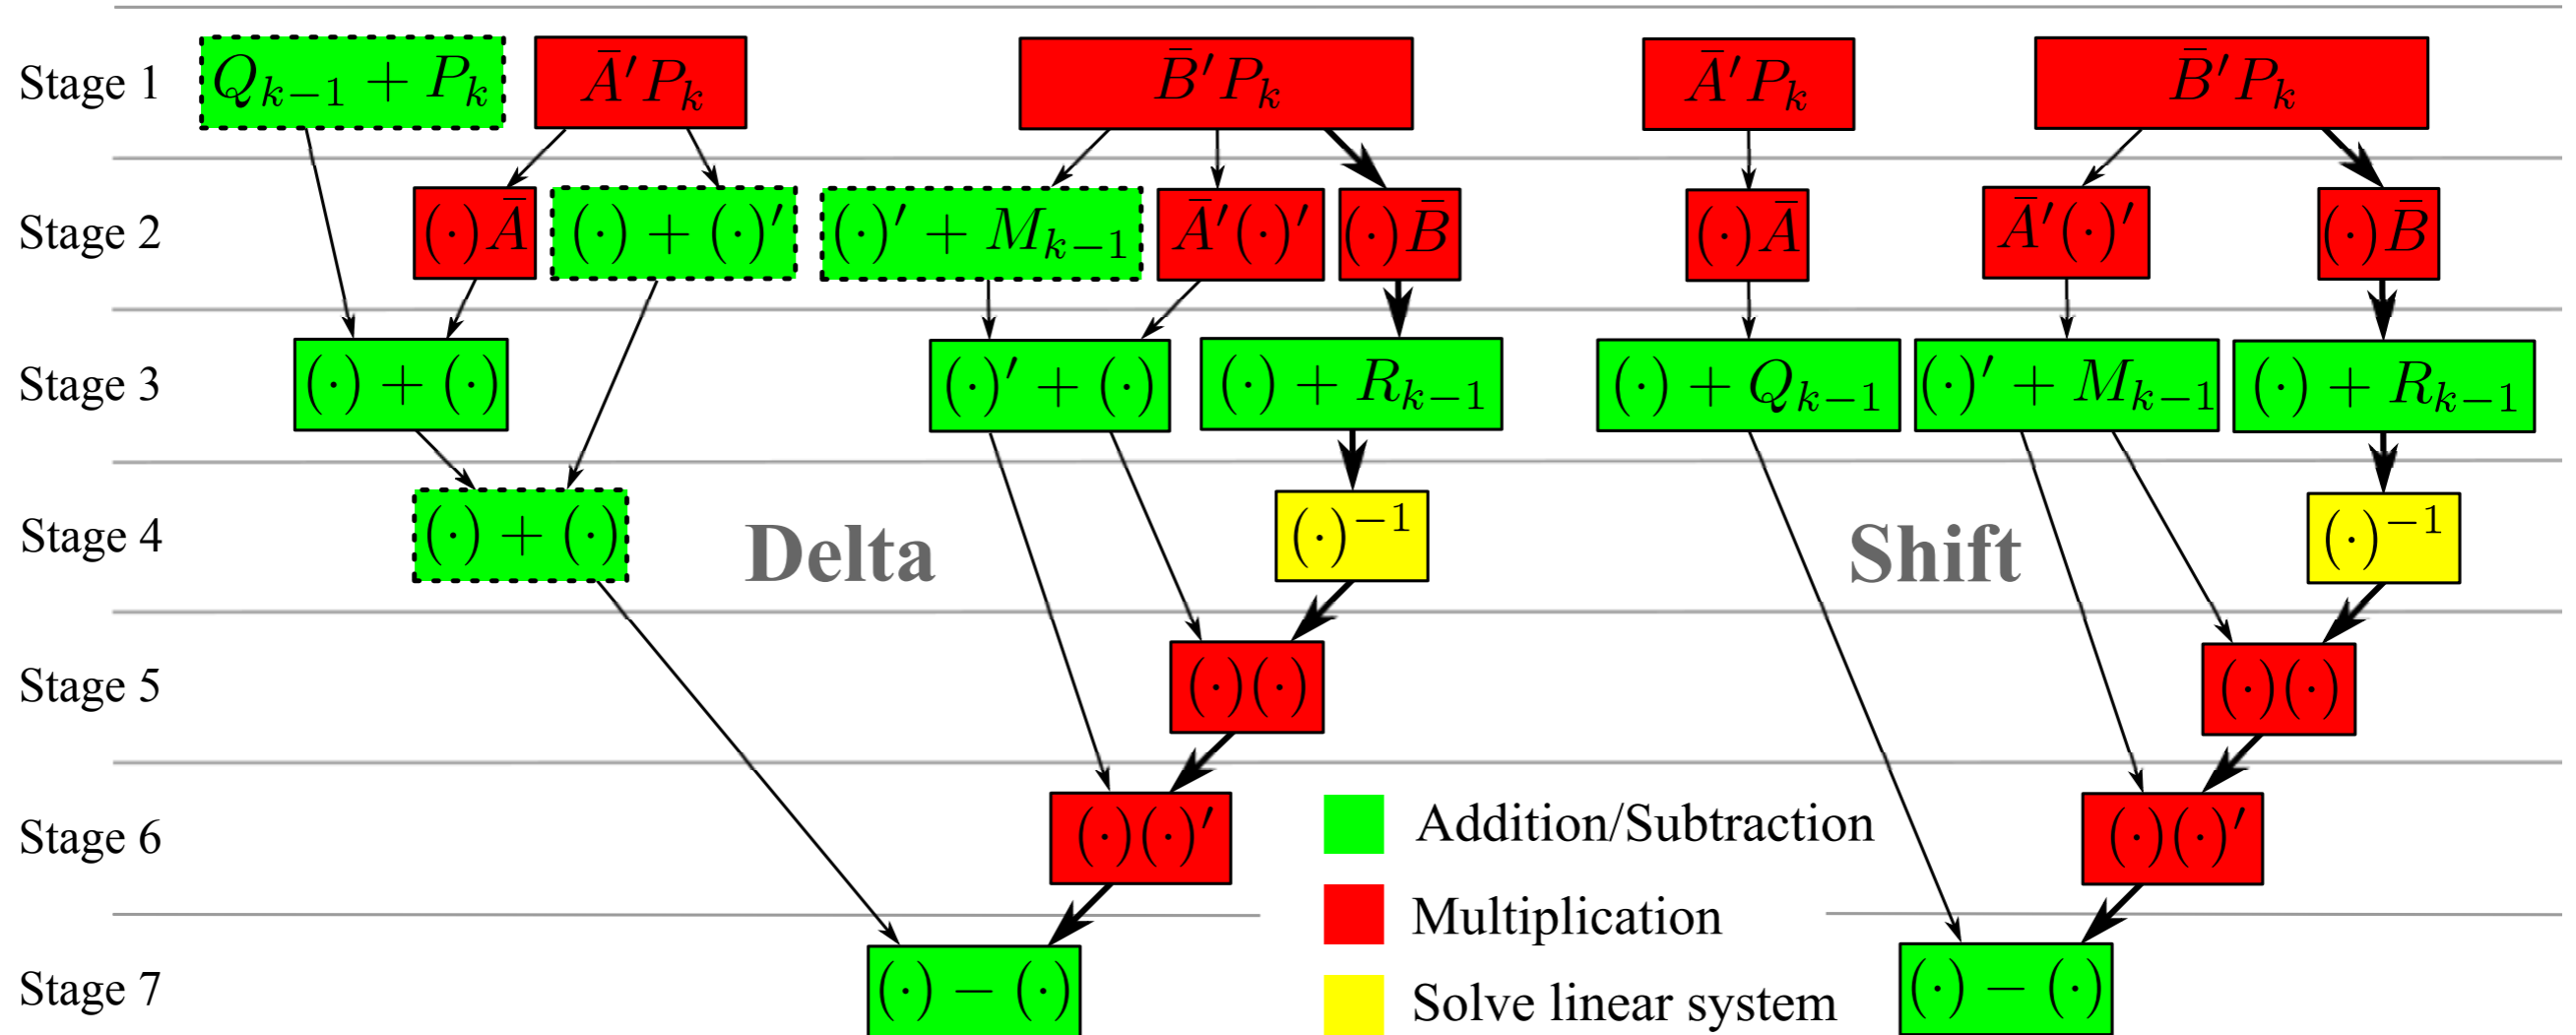

- **Interleave** search direction variables:

$$\xi := [\Delta u'_0 \quad \Delta \gamma'_0 \quad \Delta \delta'_0 \quad \Delta \lambda'_1 \quad \Delta x'_1 \quad \cdots \quad \Delta x'_N]'$$

- **Block elimination** results in Riccati recursions:

$$P_{k-1} := Q_{k-1} + P_k + h^2 A'_\delta P_k A_\delta + h A'_\delta P_k + h P_k A_\delta \\ - (M_{k-1} + h^2 A'_\delta P_k B_\delta + h P_k B_\delta) (R_{k-1} + h^2 B'_\delta P_k B_\delta)^{-1} \\ (M'_{k-1} + h^2 B'_\delta P_k A_\delta + h B'_\delta P_k)$$

# Data Dependencies in Riccati Recursion

Same amount of multipliers, adders and computational delay for a custom circuit, e.g. FPGA

# Optimal Control in Low Precision Arithmetic

Mass-spring system with 3 masses (6 states) and 2 inputs, sample period = 10ms

# Conclusions

---

- Number representation major factor that determines cost, energy, computational delay and accuracy
- Fixed-point: **Precondition** to get tight **analytical bounds** on variables in **Lanczos** algorithm to avoid **overflow**
- Low precision: **Sampled-data model** and **optimization method** crucial to successful implementation
- **Co-design** algorithm and hardware to use “just the right amount” of computational resources

# Open Research Questions

---

- Other sampled-data and number representations?
- Nonlinear systems?
- Which algorithms map easily to low precision, fixed-point or other number representations?
- A priori guarantees on accuracy, closed-loop stability, robustness and performance?
- Need control + optimization + numerics + computing
