

# OAT: Attesting Operation Integrity of Embedded Devices

PI: Long Lu, Northeastern University

NSF Award# 1748334 -- CAREER: Rethinking Mobile Security in the New Age of App-As-A-Platform

The problem: Controllers' unverifiable (blind) trust on remotely deployed IoT devices

- Issued commands executed faithfully w/o interruption?
- Incoming requests & data produced w/o manipulation?

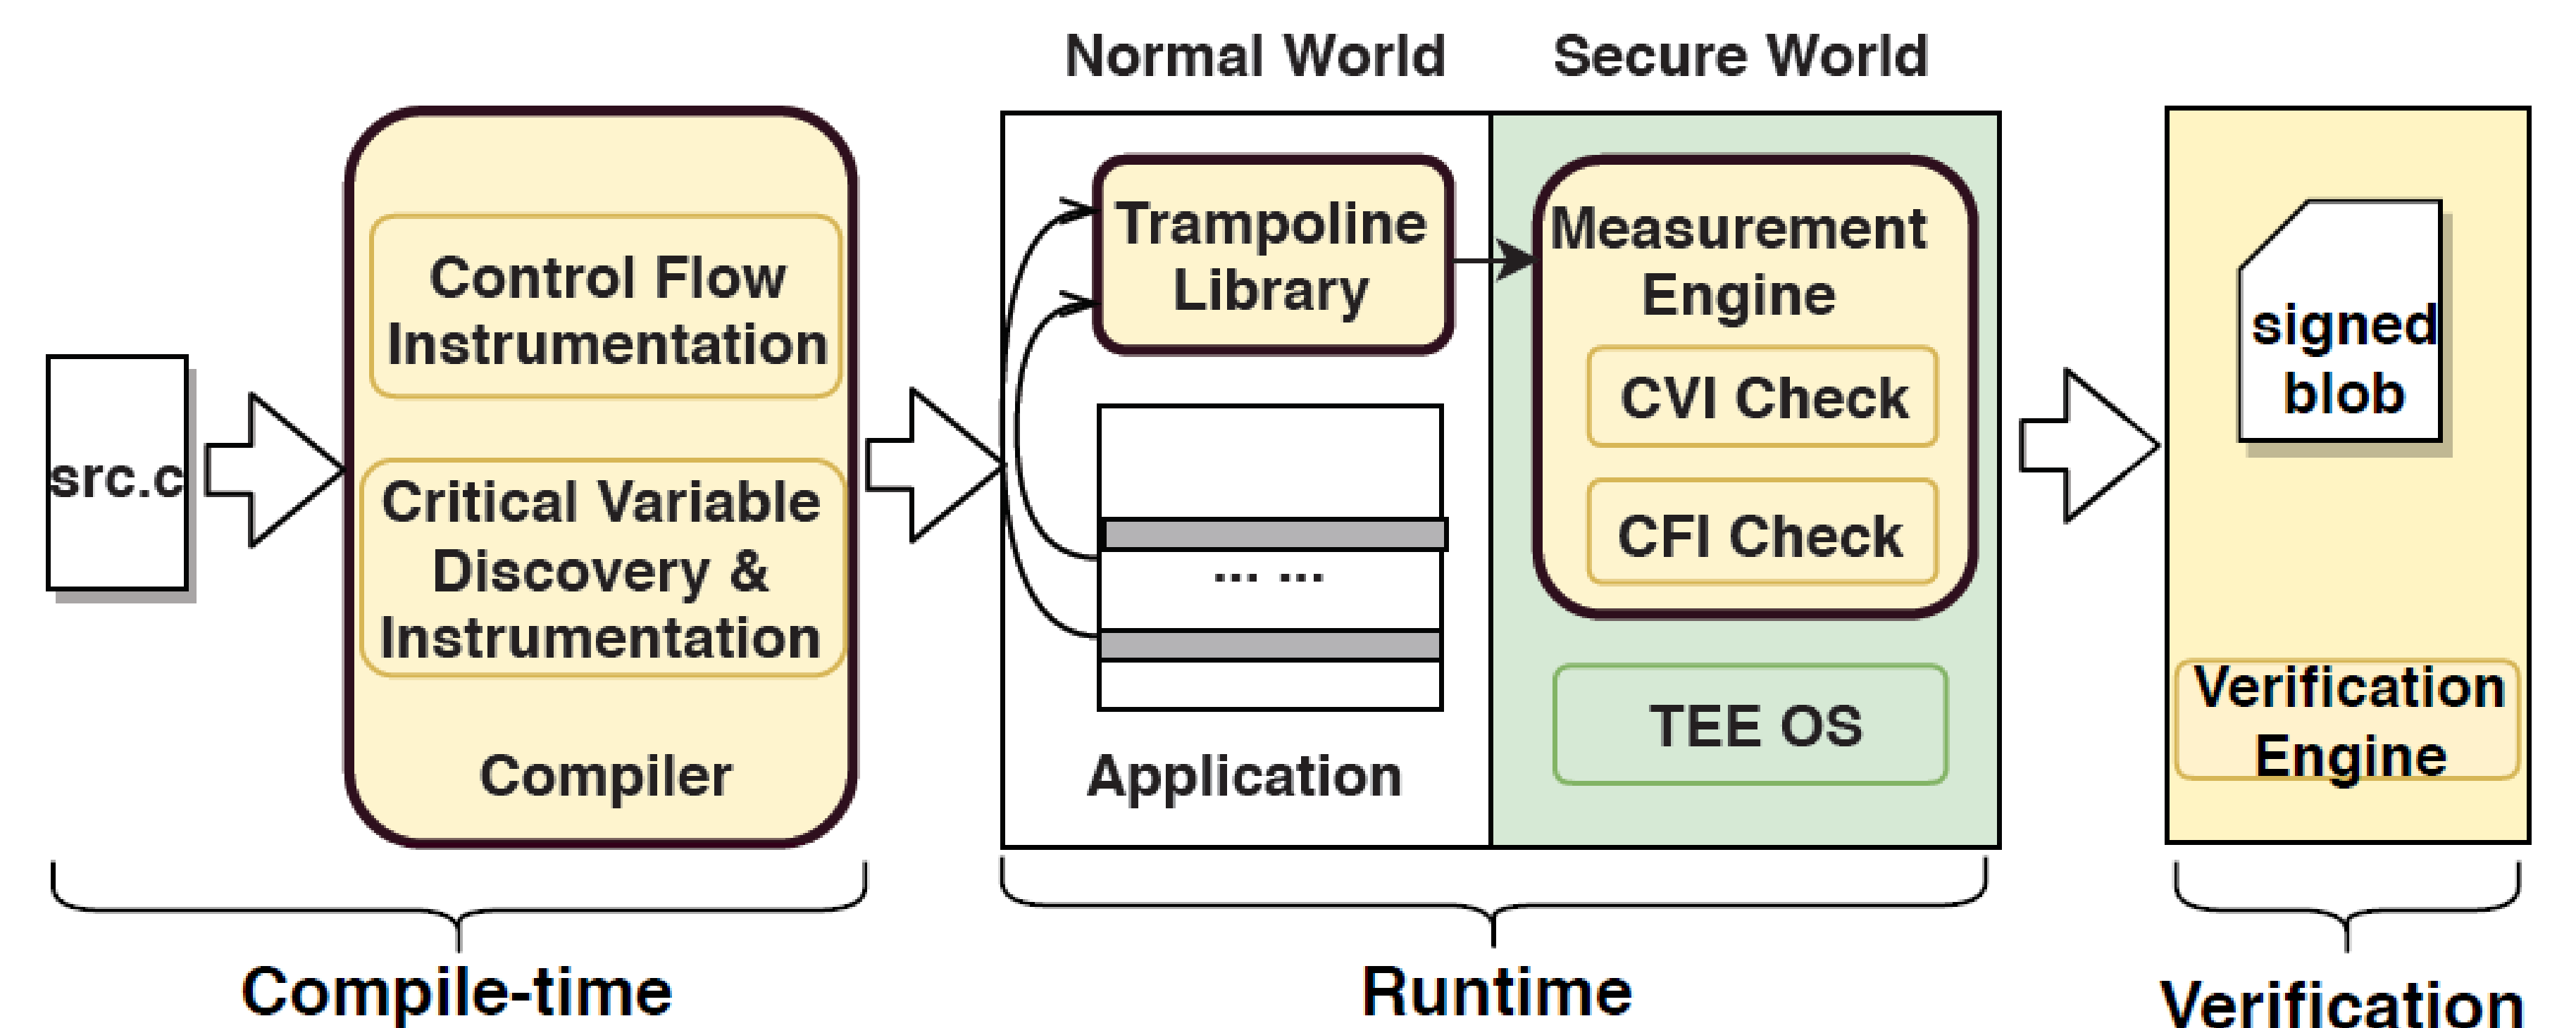

Our Solution: Remote attestation of **Operation Execution Integrity (OEI)**

A new security property formulated for embedded devices

$$\text{OEI} = \begin{cases} \text{Operation-scoped CFI} \\ \text{Critical Variable Integrity} \end{cases}$$

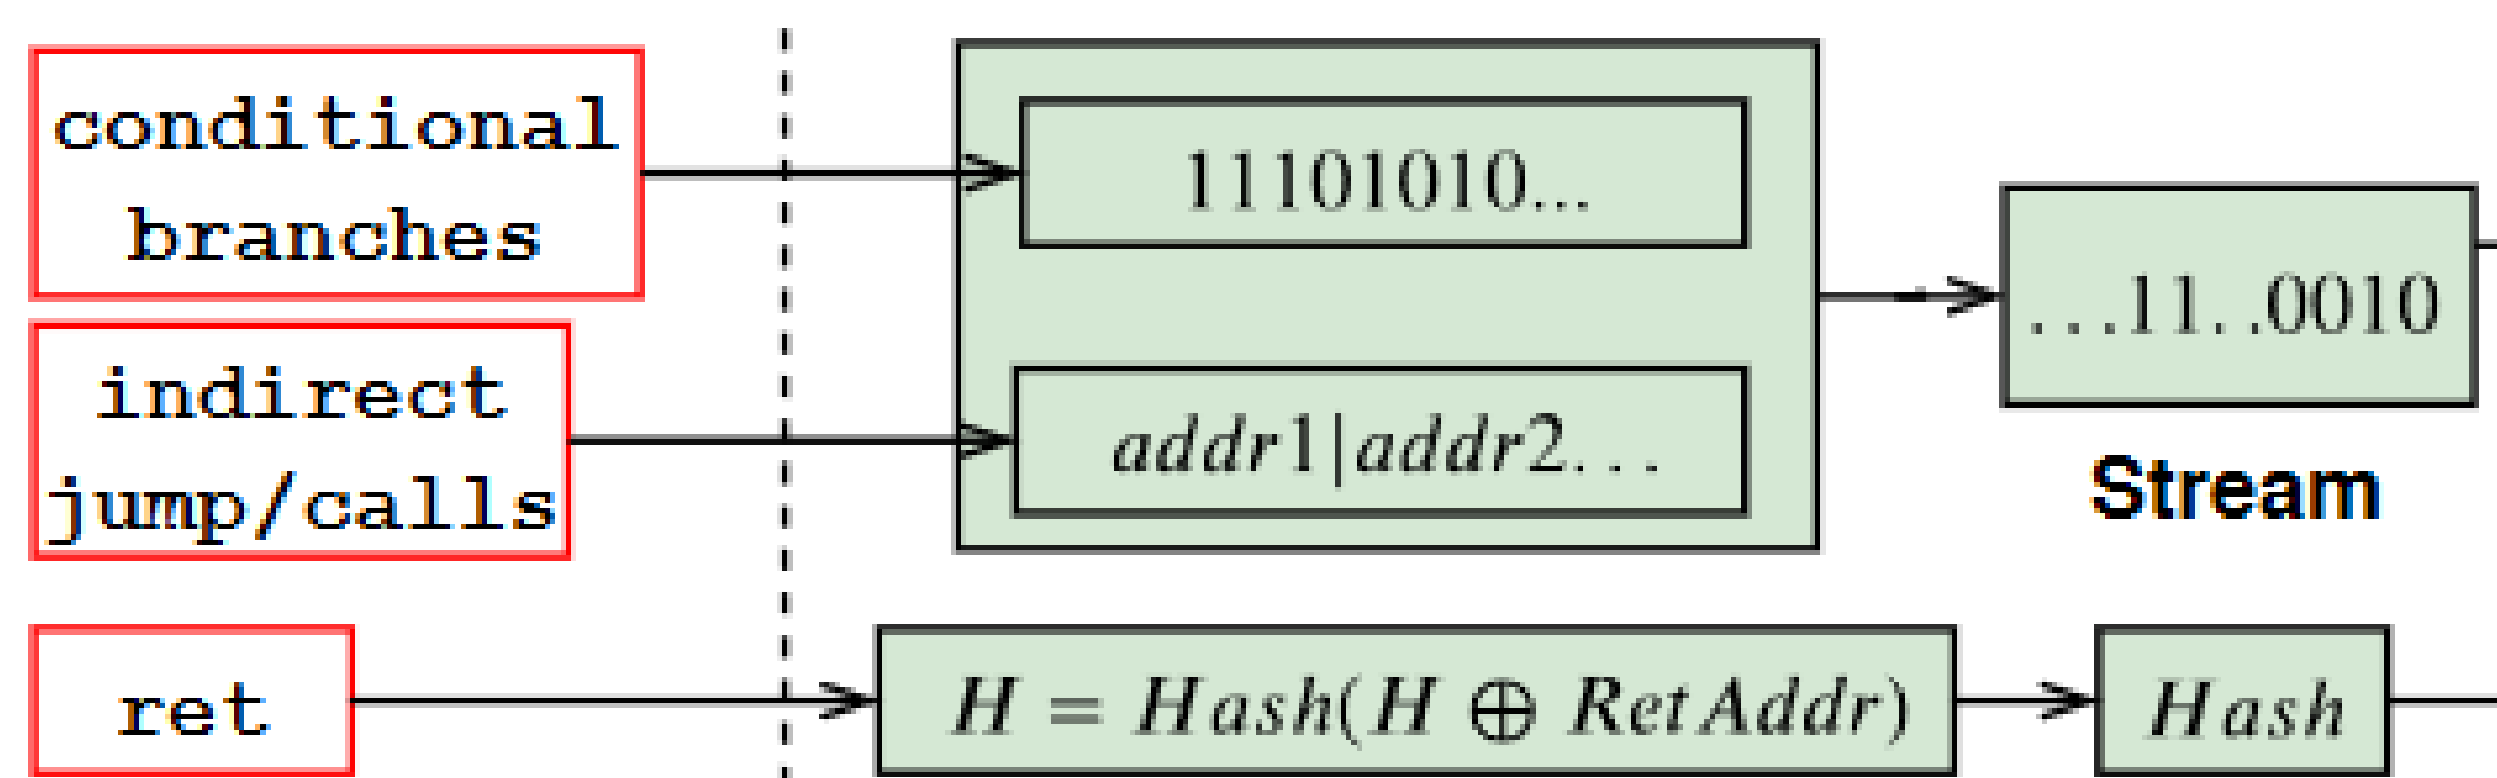

Efficiently capturing: (1) operation control flow deviations, and (2) corruption of critical data

A prover-verifier framework for attesting OEI

## Scientific Contributions

- First formulation of a security property for capturing dynamic integrity of embedded devices
- A novel control flow attestation scheme, that is lightweight and deterministically verifiable

- A novel data integrity checking method, enforcing def-use-based value consistency, rather than heavy address-based checking

## Result Highlights

- Runtime & verification overhead on real firmware

| Prog. | Operation Exec. Time |            |              | Blob Size (B) | Verification Time (s) |
|-------|----------------------|------------|--------------|---------------|-----------------------|
|       | w/o OEI (s)          | w/ OEI (s) | Overhead (%) |               |                       |
| SP    | 10.19                | 10.38      | 1.9%         | 69            | 5.6                   |
| HA    | 5.28                 | 5.36       | 1.6%         | 44            | 0.61                  |
| RM    | 10.01                | 10.13      | 1.3%         | 913           | 1.74                  |
| RC    | 2.55                 | 2.66       | 4.5%         | 10            | 0.13                  |
| LC    | 5.33                 | 5.56       | 4.4%         | 205           | 1.35                  |
| Avg.  | N/A                  | N/A        | 2.7%         | 248           | 1.89                  |

- OAT vs trace-based CFI checking

|         | SP    | HA   | RM    | RC   | LC    | Avg.  |
|---------|-------|------|-------|------|-------|-------|
| R1      | 69    | 44   | 913   | 10   | 205   | -     |
| R2      | 42941 | 3772 | 13713 | 585  | 13725 | -     |
| R1 / R2 | 0.2%  | 1.1% | 6.7%  | 1.7% | 1.5%  | 2.24% |

- OAT vs address-based data integrity checking

|         | SP  | HA   | RM   | RC    | LC    | Avg. |
|---------|-----|------|------|-------|-------|------|
| R1      | 56  | 37   | 57   | 20    | 41    | -    |
| R2      | 140 | 388  | 842  | 45    | 131   | -    |
| R1 / R2 | 40% | 9.5% | 6.8% | 44.4% | 31.2% | 26%  |
