## SaTC: CORE: Small: Collaborative: Hardware-assisted Plausibly Deniable System for Mobile Devices

### Michigan Tech

### **Challenge:**

 The existing PDE systems for mobile devices are built at the block layer and suffer from raw flash snapshot attacks and sidechannel leakages leading to deniability compromises

# Non-secure EL0 Non-secure EL1 Trigger EL3 Exception Exception Return Secure EL1 Secure EL1 Secure EL1

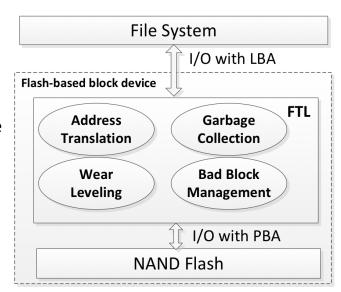

Secure World

Normal World

### **Solution:**

- Discovered various deniability compromises in the FTL and designed novel techniques to eliminate them
- Strong isolation and fast mode switching via TrustZone
- Integrated FTL and TrustZone in a unique platform

(bchen@mtu.edu)

### **Scientific Impact:**

Efficient (low-overhead) and effective (high deniability) hardware-assisted solution that leverages exiting hardware features such as flash translation layer (FTL) firmware and ARM TrustZone

### **Broader Impact and Broader Participation:**

- PDE systems in mobile devices can deny existence of sensitive data
- Involved multiple graduate/undergraduate students into the project in WSU and MTU
- Won 2022 Michigan Collegiate Cyber Defense Network (3<sup>rd</sup> Place)
- Incorporated the project into graduate courses, cybersecurity reading group, K12 summer program for females in MTU
