These challenges will provide engineering students the opportunity to validate their analytic studies through a real-world vehicle design and verification experience.

Student teams will architect, design, fabricate, predict, and demonstrate the flying and maneuvering capabilities of an unmanned, electric and/or non-electric powered, radio controlled or autonomous vehicle that can best meet the specified mission profile. The goal is a balanced design possessing good demonstrated qualities both with a payload and without, with reliable pickup/dropoff of payload, practical and affordable manufacturing requirements, and high overall vehicle performance.

Recent Forum Topics

Simulation Outputs
distance clarification for system mission 1
Map format
Individual mosquito trap coverage
Bullet M2 interface with UAV
issue connecting to UAV via telemetry module
Issue with Pixhawk output to ESCs
Would a human be able to access the UAV after a trap is dropped off?
Are we supposed to drop and then pick up the trap at a waypoint?
NUC WiFi and Bluetooth

Feedback

Anatomy of a CPS-VO Competition

- Necessary: common testing framework—simulators and tools
- Necessary: common hardware framework to reduce design space exploration and debugging
- Goal: support different team sizes/scales
 - Challenges should have hooks, with optional involvement
- Goal: support long/short course involvement
 - Challenges should support refinement over a longer term
- Goal: enable transformative experiences for participants
 - Final meetup with external sponsorship for qualified teams

Interaction based on Design Course Constraints

- Waterfall and externally-managed design courses require concise, fixed conditions and rules

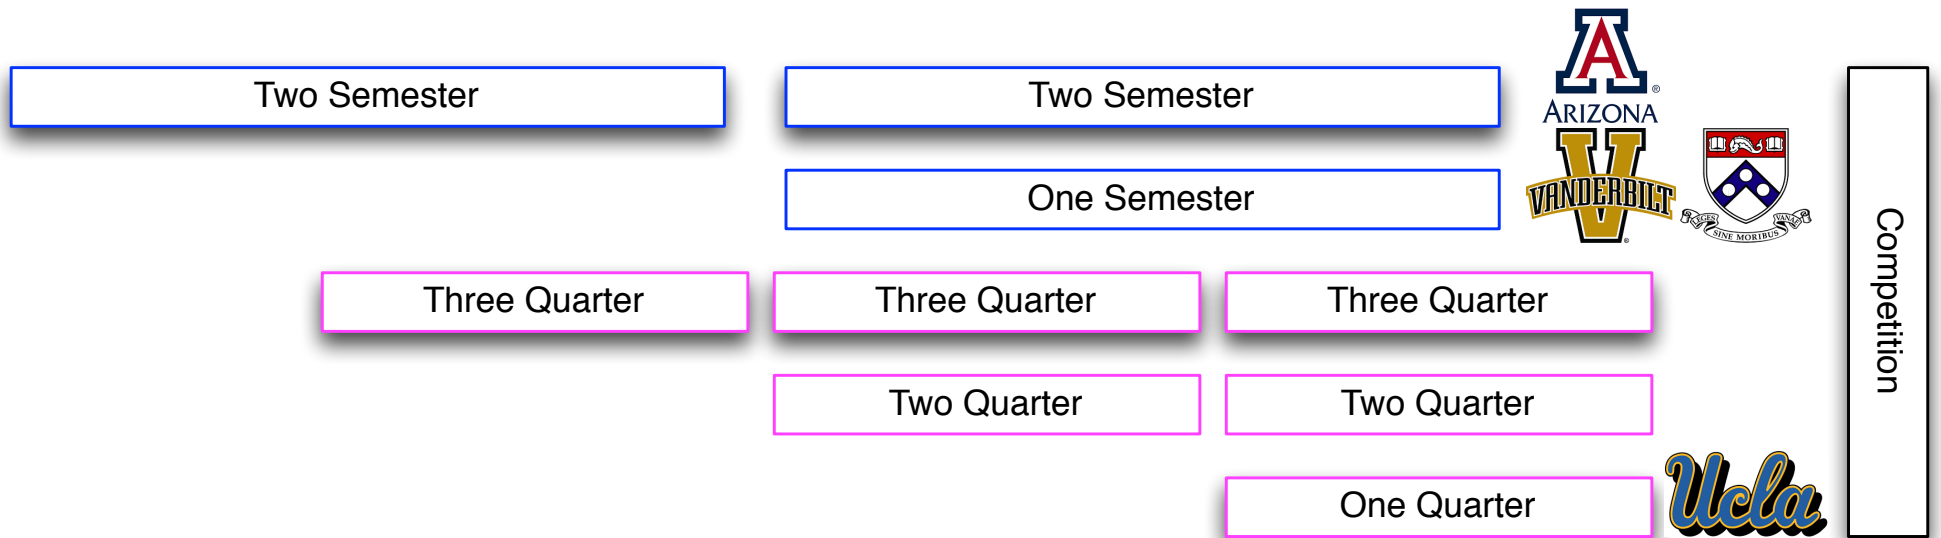

Interaction based on Design Course Constraints

- Some schools permit equipment purchase; others do not require it

Interaction based on Design Course Constraints

- Two-term, two-quarter, and 1-term must each have a suitable challenge(s)

Ex: Two Semester teams with large classes participate in all challenges

Ex: Two Semester team of 5 participates in only vehicle challenges

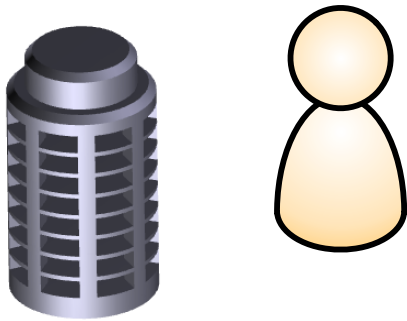

Ex: One Semester large course of 40 students fields 5 teams, one for each challenge problem

Ex: Two Quarter independent study course (10 students) works only Simulation Missions 1, 3

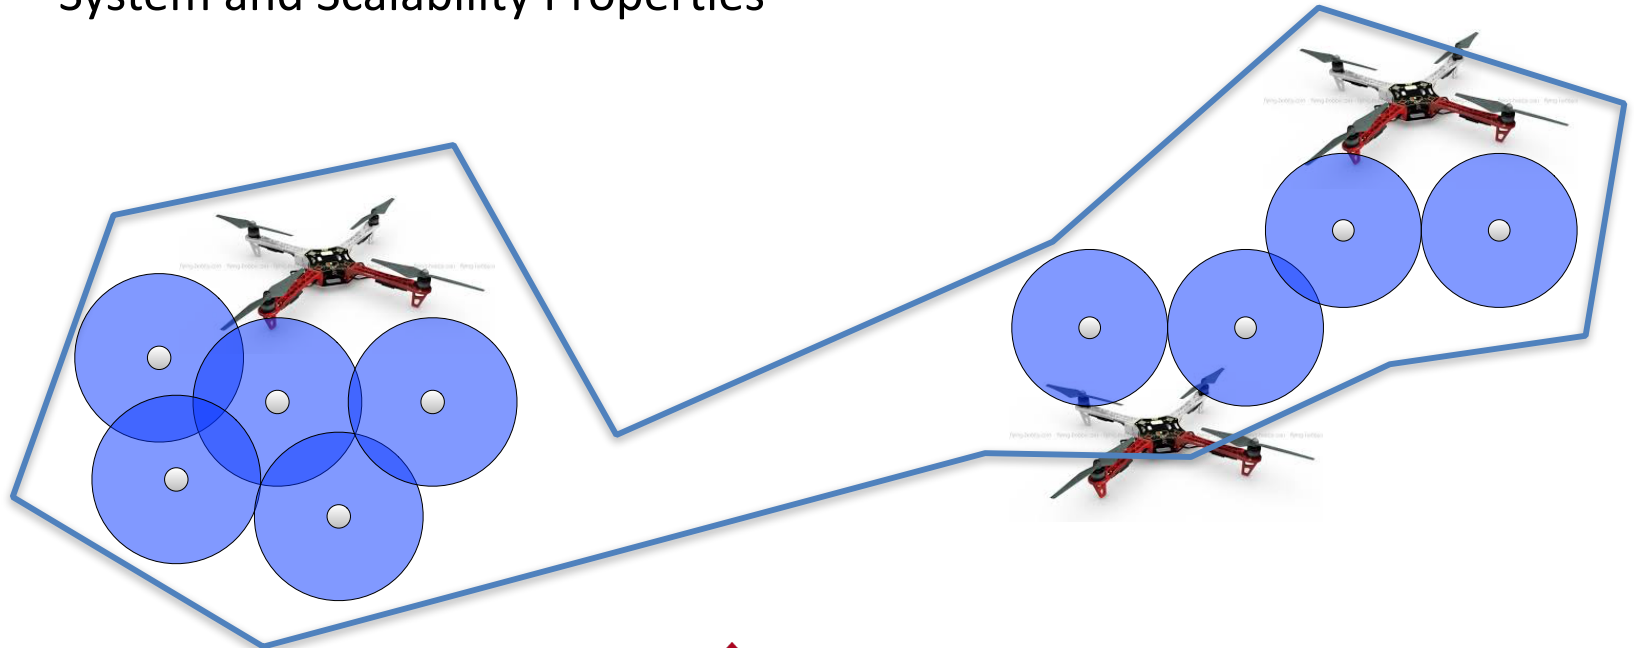

Interdisciplinary Courses: small teams (3-5 students)

Platform Design and Implementation

Trap pickup/dropoff mechanisms

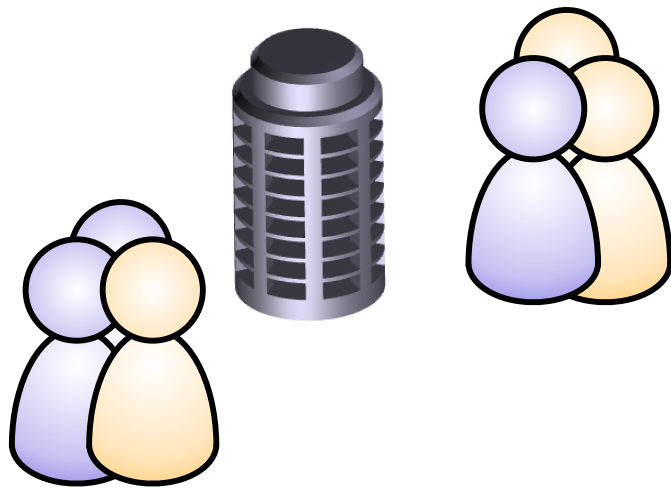

System and Scalability Properties

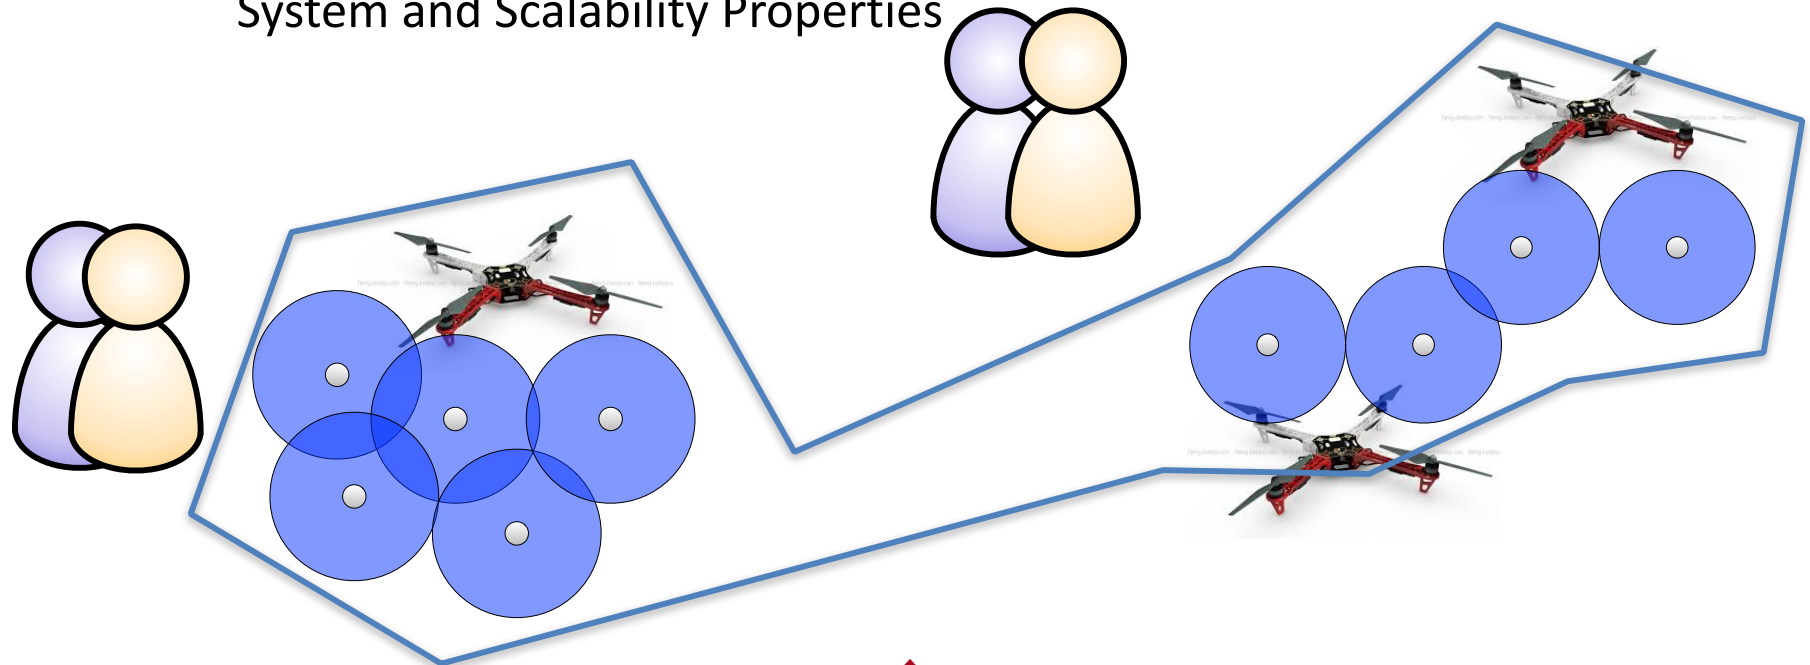

Interdisciplinary Courses: medium teams (10+ students)

Interdisciplinary Courses: large teams (20+ students)

Platform Design and Implementation

Trap pickup/dropoff mechanisms

System Availability Properties

Final Competition Needs Breathing Room

- Proposed schedule:
 - Day 0: reassemble your vehicles after shipping, and fly under human control
 - Day 1: safety checkout flights, ensure minimum qualifications
 - Day 2: simulator-based portion of the competition

Two-Track Competition

- Track 1: UAV missions (9 months, Fall 2017-Spring 2018)
 - Continue in track where teams can build their own platforms
 - Continue to utilize shared simulation engines and developed models
 - Successful teams invited to final Challenge Site
- Track 2: Ground-vehicle missions (3 months, Spring 2017)
 - Based on car-like robot (CAT Vehicle)
 - Software- and perception-based competition
 - Successful teams will get their experiments run on the physical platform

Track 1: UAV Missions

- Technically:
 - Reinforces tight coupling of hardware and software
 - Low reliance on simulation for critical system
 - High reliance on simulation for algorithms at scale
 - “Real” system interaction *from very early in process*
- Administratively:
 - Projects with hardware purchase
 - Institutions with Part 107 pilots or indoor flying facilities
 - Timelines suitable for replacement parts

Track 1: UAV Missions

- Vehicle Missions:
 1. Payload pickup/dropoff (HIL)
 2. Location scouting (A)
- System Missions (all in simulation):
 1. Location scouting at scale (A)
 2. Disease tracking at scale (A)

(A) Autonomous

(HIL) Human-in-the-loop with Autonomy

Track 2: Ground-vehicle missions

- Technically:
 - Enables longer missions (no batteries to recharge)
 - High reliance on simulation for testing of critical system
 - Enables distributed computation models
 - “Real” system interaction *only at conclusion*
- Administratively:
 - Projects with no required hardware purchase
 - Institutions with low tolerance for risk in project demonstrations
 - Single-discipline courses

Track 2: Ground-vehicle missions

- Vehicle Missions:
 1. Identify objects in environment (A)
 2. Modify velocity to improve object identification (A)
- System Missions:
 1. Synthesize simulation environment from “run” (A)
 2. Reduce sensors needed for correct observations (A)

(A) Autonomous

(HIL) Human-in-the-loop with Autonomy

Competition Timelines for UAV Track

- Competition Rules released April 2017
- To be held on University of Arizona's Mall
- Focus is on autonomous pickup of mosquito traps

Competition Timelines for CAT Vehicle Track

- Enrolling teams now @
2017 CAT Vehicle CPS-VO Challenge

October 31, 2016	Announce the Challenge and its timelines at the NSF Cyber-Physical Systems PI Meeting
January 31, 2017	Deadline for Phase 1 entries
March 11, 2017	Deadline for Phase 2 entries
March 31, 2017	Deadline for Phase 3 entries
Week of April 24, 2017	Final Challenge to be held on the University of Arizona campus

2017 CAT Vehicle CPS-VO Challenge

The screenshot displays a Linux desktop environment with a terminal window and a web browser window. The terminal window shows the following commands and output:

```
sprinkle@jmecatvehicle: ~/catvehicle-1.1.0pre/src/azcar_sim/scripts/tests/openloop
/home/sprinkle/catvehicle-1.1.0pre/src/... x  sprinkle@jmecatvehicle: ~/catvehicle-1... x  sprinkle@jmecatvehicle: ~/catvehicle-1... x
sprinkle@jmecatvehicle:~/catvehicle-1.1.0pre$ source devel/setup.bash
sprinkle@jmecatvehicle:~/catvehicle-1.1.0pre$ cd src/azcar_sim/scripts/tests/openloop
sprinkle@jmecatvehicle:~/catvehicle-1.1.0pre/src/azcar_sim/scripts/tests/openloop$ ls
hardLeft.bagy  hardLeft.sh
sprinkle@jmecatvehicle:~/catvehicle-1.1.0pre/src/azcar_sim/scripts/tests/openloop$
```

The web browser window displays a page with the following content:

2016 - 5:19pm

o provide an open-loop control input as recorded in a .bagy file. The vehicle will turn at an extremum of its velocity.

tion

with any simulation launch file. For this launch, I will use the neighborhood.

im azcar_neighborhood.launch

at is happening, use (in a new tab) either gzclient, or

Objectives:

Requirements

Replace our perception algorithms with yours, in order to generate a model of the world you drive through.

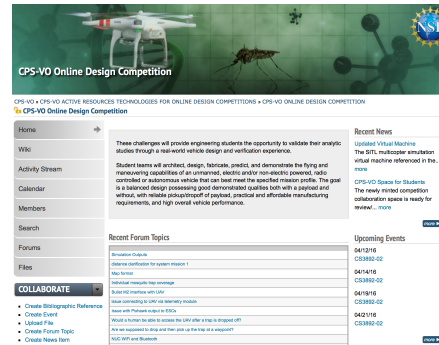

Methods

Design and training

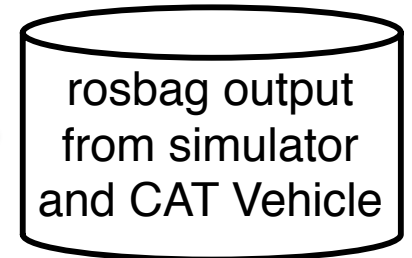

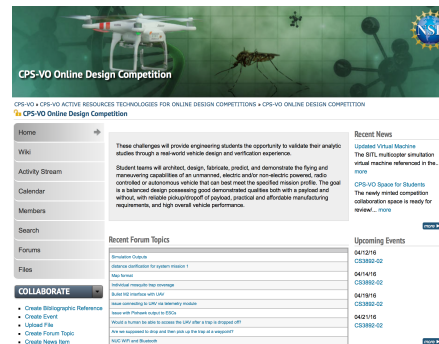

Testing to confirm interfaces

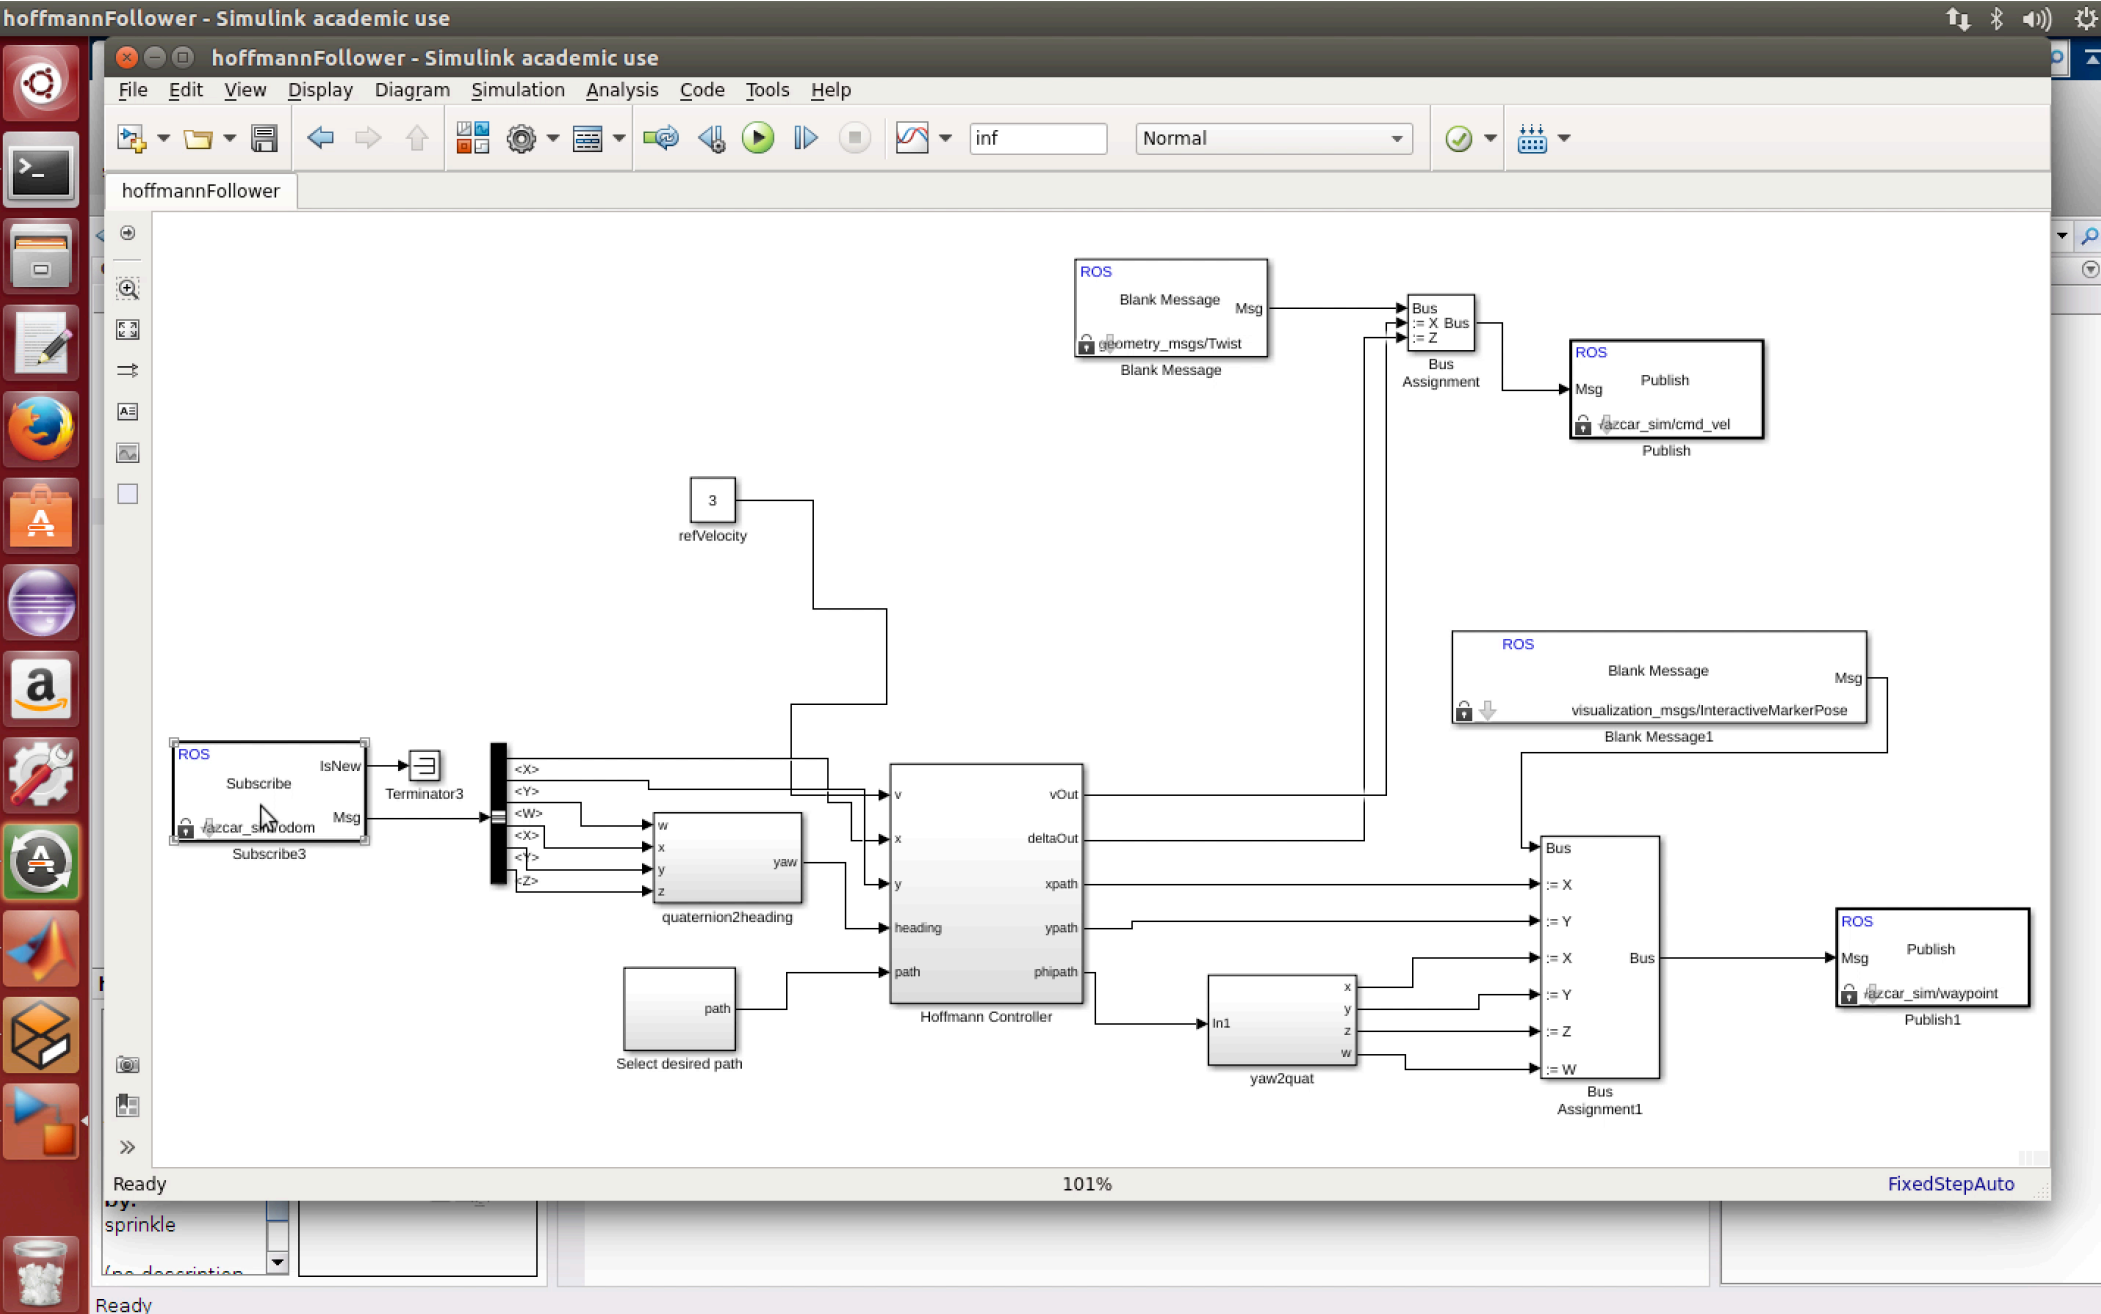

Phase (X) submission

CPS-VO Cloud Resources

Approach: Model-Based Design of ROS with Simulink

Phases

Phase 1: Can you RTFM* to **run the tutorial experiments and make your team's first submission** on the CPS-VO?

Phase 2: Submit models and software that **consume rosbag files, and output interesting objects.**

Phase 3: Teams must submit models and software that **consume vehicle and sensor data, control the velocity of the vehicle, and produce an output Gazebo world file.**

Final Challenge: Teams will have an opportunity to **modify and then re-run their Phase 3 models on the CAT Vehicle in Tucson, AZ, over a period of 2-3 days**.**

* Read The Freely-available Model-based design tutorials on the CPS-VO

** Pending final sponsorship agreement
